

1 Order Shift Log

Overview

The order shift log is a function in production management and represents the evaluation of input order data (quantities and times) relating to the recorded shifts. It provides the information that the person responsible for production - the foreman or the shift supervisor - needs for the daily reports.

Integration

This function provides the information about the operations completed during a shift. In addition to the quantities produced, the time that was required in each case is also shown. The data are shown for each order/ operation. The data displayed is the result of the order-related data entered at the terminal during posting.

Selection criteria

All operations are shown in the order shift log that match the restriction defined in the selection panel. Here, if the operations do not require batch management, the BDE log records of record type "U" and "E" are considered; for operations that require batch management, BDE log records of record type "H" are considered.

The application provides the following selection criteria:

Workplace from ... to ...

Selects the log records posted to the workplace that was entered, the responsibility area of which the user has authorized rights to. You can also run a search using wildcards in the "from" field.

Group from ... to ...

Selects the log records posted to the workplace that was entered, the responsibility area of which the user has authorized rights to, and that are assigned to the entered group. You can also run a search using wildcards in the "from" field.

Cost center

Selects the log records posted to the workplace that was entered, the responsibility area of which the user has authorized rights to, and that are assigned to the entered cost center. You can also run a search using wildcards.

Date from... to...

The time period entered restricts the selection by log records. Selects the log records that have a posted shift date within the defined period.

The preset value is "Today minus 7 days" to "Today". The date is calculated based on the Gregorian calendar.

Shift all, 1, 2, 3, 4

Within the entered period, select only those log records that are assigned to the shift entered according to the shift model.

Operations that are logged in during the currently running shift at the time the data are selected are not considered, because no log records have been generated for them yet.

Order shift log

The fields listed below are displayed in the table: Additional order-related fields can be added when customizing the system to customer specifications.

Shift date

Shift date of the shift in which the operation is completed.

Shift

Shift in which the operation is completed. In the process, the shift number is determined based on the shift that is active at the time of posting, as defined in the shift model, for the workplace at which the operation is logged in.

Workplace

The workplace at which the operation is being completed in the selected shift is shown in addition to the order and item/article number.

Order

Order number of the order/ operation.

Operation

Operation number for the operation

Article

Article number/item number of the operation.

Production

The time of production (RPA 11) entered for this operation in relationship to the selected shift.

Total time

Sum total of all production and standstill periods (sum of RPA 1 - 11). The separate RPAs are listed after the recorded quantities.

Yield

The yield entered for this operation in relationship to the selected shift.

Scrap

The scrap posted for this operation in relationship to the selected shift.

Unit

The relevant unit of quantity.

SUT

Secondary utilization time

DCI

Disturbance-caused interruption

LCI

Logistics-caused interruption

SCI

Staff-caused interruption

IMN

Idle mode not scheduled

IMS

Idle mode scheduled

SET

Setup

STA

Startup

U8

User RPA

U9

User RPA

MUT

Main utilization time

Operation designation

Operation designation for the operation

MES order number

Combined order/ operation number.

Please note:

Displaying the actual quantities and the actual durations (RPA)

For workplaces that are either not assigned to any terminal or for those that are assigned to a terminal configured as a BDE terminal, there is no shift automation. This means that there are no automatic order or person-related postings at the end of shifts. Because this means that there is also no exact shift relationship to the entered quantities and durations, in this case a proportionate assignment is made in the shift log. This assignment is made using the workplace's shift calendar as the basis.

Example:

In this case we have a shift model set for shift 1: 6.00 am to 2.00 pm and for shift 2: 2.00 pm to 10.00 pm. This shift model is assigned to a workplace that is in accordance with the criteria listed above. Furthermore, we also have an OP log-in at 1.00 pm and an OP logoff at 4.00 pm. For the OP logoff, 90 is uploaded as the yield.

In this case, the shift log for the operation in shift 1 will calculate an order duration of 60 minutes and a yield of 30. For shift 2, an order duration of 120 minutes is calculated and a yield of 60. The RPA-related durations are also calculated based on the shift model that the workplace is based on.

Operations that are logged in during the currently running shift at the time the data are selected are not considered, because no log records have been generated for them yet.

Graphic order shift log

After the logs are preselected, they can be displayed graphically by article in the detailed report: By selecting an entry, the "Graphic order shift log" menu item appears to the left.

In the graphic presentation, all articles are displayed that were produced during the evaluation period for the selected data record. On the one hand, the posted quantities that accumulated at article level are displayed and on the other hand the corresponding durations are shown.

The top bar chart shows the article numbers on the Y axis and the produced quantities on the X axis. The bottom bar chart shows the article numbers on the Y axis and the absolute values (durations) on the X axis.

In both charts, a legend provides information about the colors chosen for the bars.
