

1 Complaint analysis

Overview

Menu	Quality management → QM evaluation → Complaint analysis Quality management → Complaint management → Complaint analysis
Transaction code	cmep
Function authorization	cmep

Purpose

The complaint analysis allows for complaints to be evaluated in different ways using pivot functions. These functions provide different presentation options, e.g. the graphic shows the complaint details including reasons for each complaining party over a specified period of time. Use these analyses to identify the core areas where action is required.

Integration

The complaint analysis function only evaluates complaint management data. In this context, you can distinguish between complaint header data and complaint detail data.

Requirements

There are no special requirements. You only need to record complaints including the relevant detail data.

Selection criteria

Selection criteria are self-explanatory and not described separately.

Toolbar

There are no other special function buttons in addition to the standard functions/features.

Detail applications "Graphic complaint analysis"

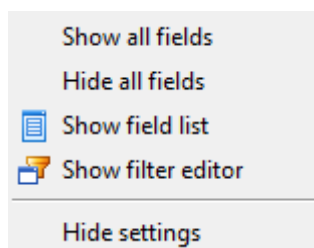

Data is presented in a pivot table including bar charts. Different application functions are available to display data. The data basis is restricted to the complaint data you have selected beforehand by entering selection criteria.

This document does not describe the general pivot functions in more detail. The paragraphs that follow only describe the basic functions of this evaluation/report.

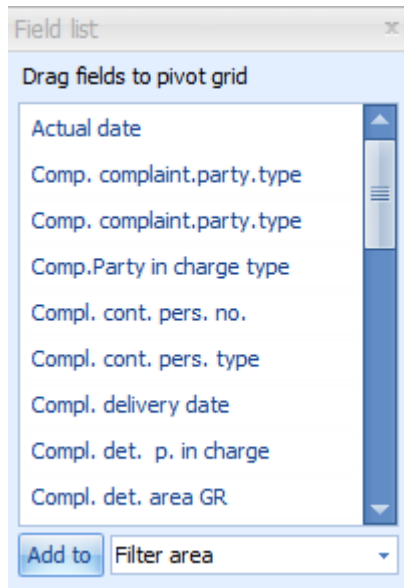

Pivot evaluations/reports provide the following benefits:

- You can quickly summarize and present large amounts of data.
- You can exchange rows and columns to have the source data summarized differently.
- You can use simple filters by "drag and drop" including detail filters.
- The interactive way of presentation allows you to summarize and analyze data in different formats and using different calculation methods.

Right-click to open the below context menu:

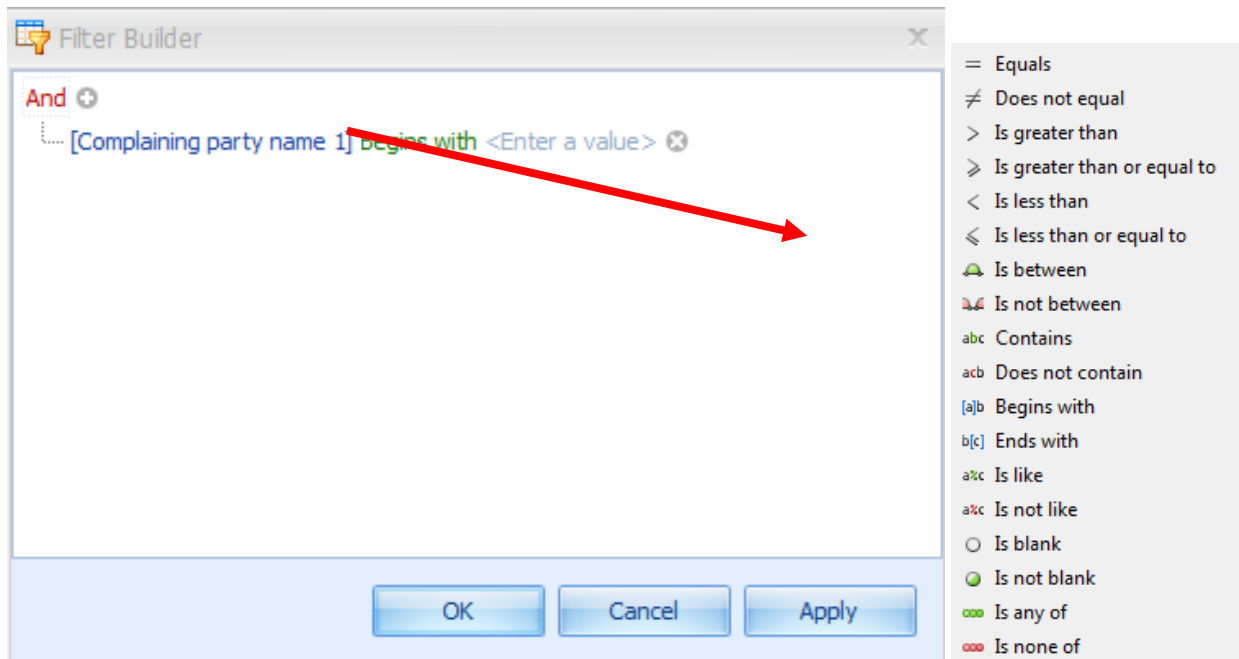

Use the function "show field list" to select the fields you want to integrate in the pivot analysis. The below figure shows how a field list could look like.

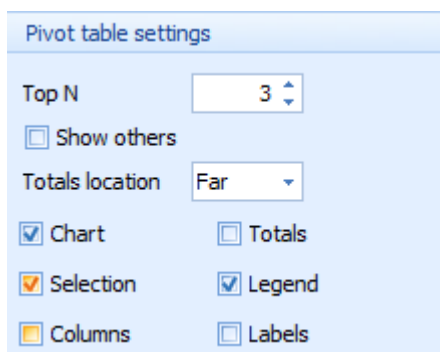

You can drag the requested fields into the evaluation area by "drag & drop".

Apart from the selection criteria, use the "show filter editor" function to further restrict the data basis.

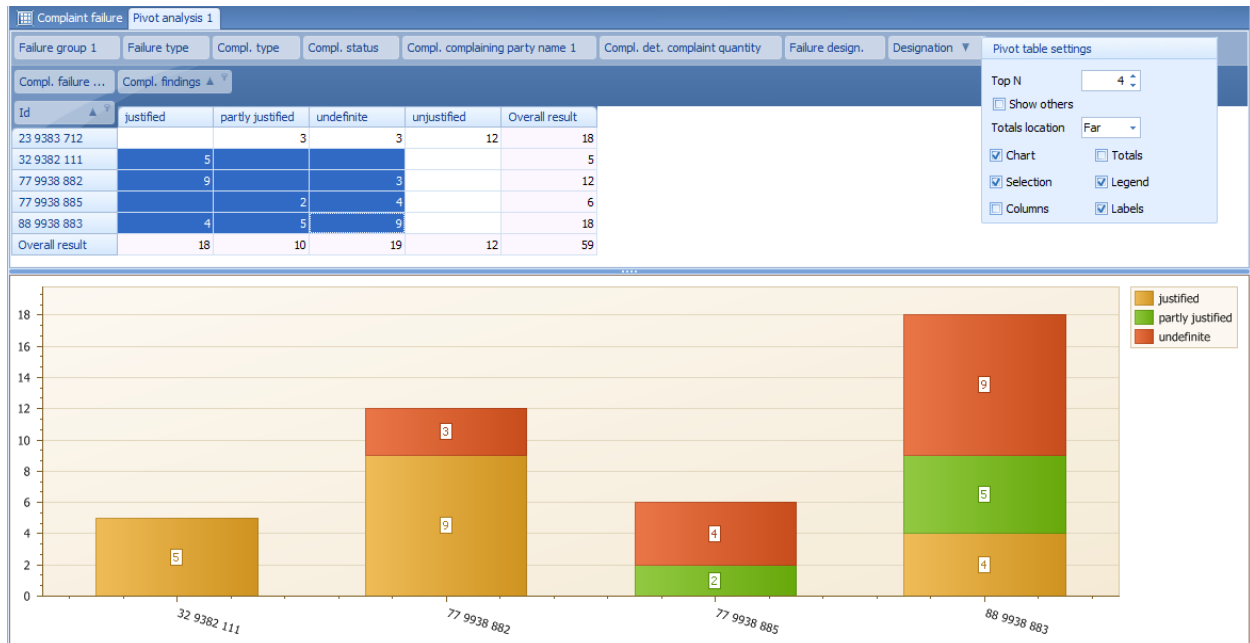

The below dialog opens if you want to display the settings:

If you check the "selection" option and select a specific area in the table, the graphic only refers to this selection. In this case, the graphic presentation of data is based on the selected rows. If you check the "label" option, you can display the total number for each bar.

The below figure illustrates these functions.

Check the "totals" option to display the row "overall result" in the bar chart. Check the options "selection" and "totals" and the graphic only shows the totals of the columns selected in the table.

Check/uncheck the option "columns" to switch between the graphic presentation of columns and rows.

Detail applications "complaint analysis list"

The complaint analysis list shows the complaints including referenced data that have been filtered on the basis of the used selection criteria. Usually, the referenced data corresponds to the field list of the pivot analysis.
