

1 Cost Types

Overview

Menu	Master data → Quality management → Cost types
Transaction code	CO
Function authorization	CO

This master data catalog has been designed to define different cost types at a central place providing the option of pre-assigning cost rates and durations as well as to define and assign cost groups.

Utilization

The "cost type" field is the key field, i.e. while saving a new cost type, the system checks whether there is already a cost type with this key information.

When a new cost type is created or an existing cost type is changed, the selection lists "areas" and "valid for" define to which areas and modules the cost type applies. Selection lists allow for several entries to be selected. Consequently, it is possible to assign a cost type, e.g. to the areas "goods receipt" and "production" but not to the "goods issue". When costs are later assigned to a complaint, it is possible to restrict the cost types accordingly by filtering specific areas and modules in the selection list of costs.

The initialization of an amount may, for example, be enabled when selecting a cost type by entering a value in the "initialization amount" and "init duration" fields. This simplifies the collection of complaint costs considerably. This function should be applied, in particular for, potential lump sum costs, such as "delivery/shipment", "processing fee" or "rework". Provided that fixed lump sum costs or lump sum hourly rates (e.g. for rework) are to be defined, the field "initialization amount" is to be assigned to the cost rate and the field "init duration" is to be assigned the value 1, for example. If a cost type that is configured in such a way is assigned to a complaint, the "amount" field immediately shows the initial amount and the "duration" field shows the initial duration. Before saving this assignment, the duration may still be changed e.g. to 1:30 (1 hour and 30 minutes). Once saved, the value entered in the "amount" field is multiplied by the specified duration and saved as the new cost rate.

Cost type groups may optionally be defined beforehand and the relevant group can be assigned to the cost type. This option should not be missed out as it provides improved reports/evaluations. Groups can be assigned by opening the group tree using the magnifying glasses function. The requested group may be selected and taken over in the group tree by way of hierarchical tree entries. The assigned group including the hierarchical group structure can then be found in the "groups" field of the editing dialog for the cost types.

The columns "group 1" to "group 5" represent the group hierarchy if cost types are displayed in lists.

Groups are edited in the "cost type groups" application, which is described in the manual entitled [MOC_Groups.pdf](#).

Under certain circumstances, it might be reasonable and recommendable to use a self-explanatory structure for cost type numbers as cost key.

By distinguishing between active and inactive cost types, it can be defined whether or not they are still to be available in selection lists for the costs in the data acquisition process. However, inactive cost types may still be evaluated at any time. Moreover, inactive cost types may also be reactivated at any time.

Integration

The cost type catalog is used in the complaint module to record complaint costs. In addition to this, it represents the basis for the analysis of complaint costs.

Prerequisite

Functional requirements from other applications do not have to be met to be able to use this function.

Selection criteria

Selection criteria are self-explanatory and not described separately. Cost types of a group can be filtered in the "groups" tab using the icon  and selecting a cost type group (in tree structure). The group tree list provides a function to cancel and accept the entries made.

The "inactive" filter field allows for the data set to be restricted to active or inactive cost types.

Field descriptions

The sections that follow describe the selection criteria that are not self-explanatory.

Cost type

ID number of the cost type

Cost designation

Designation of the cost type

Inactive

The "inactive" check box identifies cost types that are no longer to be used in the active data acquisition process.

Valid for

Modules/applications for which the cost type applies. A selection list is available.

Areas

Areas for which the cost type applies. A selection list is available, e.g. goods receipt, production, goods issue, complaint management.

Initialization amount

Definition of the initial amount that is, for example, to be pre-assigned when assigning a cost type to a complaint.

Init duration

Definition of the initial duration that is, for example, to be pre-assigned when assigning a cost type to a complaint.

Cost rate amount

Should be assigned to the same value as in "initialization amount", as this amount is also saved when assigning a cost type to a complaint. The "cost rate amount" field shows the original amount if the duration and, as a result, the cost rate (after saving) is changed when assigning costs or if the cost rate is changed directly.

Groups

In a tree structure the group field shows the assigned group or allows for groups to be assigned in form of the tree structure.

Toolbar

There are no other special function buttons in addition to the standard functions/features.
