Purpose

The personnel report function has been designed to create a list, where all personnel postings are displayed with a target/actual comparison on time and quantity within a certain time interval for selected people.

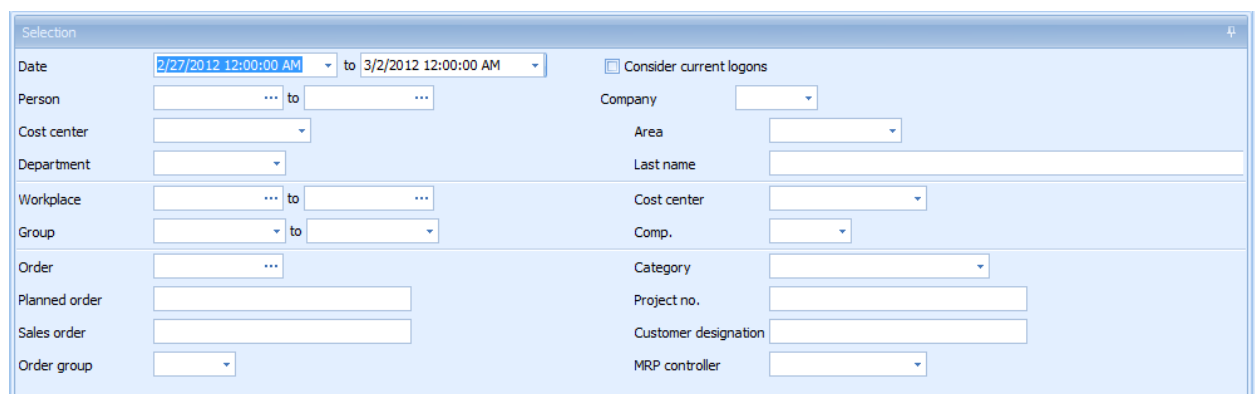

Integration

Order data logs are the data basis for the evaluation .

Requirements

If you want to use the personnel report, personnel postings must have been executed and the respective postings must be available in the system.

Selection criteria

The application provides the following selection criteria:

Date ... to ...

Data records are restricted by the date and time.

The evaluation period refers to the logon time of the person, that is, all person-related log records (record type B) are selected with a logon time within the selection period.

In the case of interrupted operations, the log on time from the persona-related log records is used. The current logged on date is used for logged operations. If the selection period exceeds the period for the online data area, the data from the medium-term data area is automatically selected. You need not explicitly activate the access to the medium-term data area.

Consider current logons

This option enables to view the people who have logged in during the specified period of time and who are currently still logged on.

Person from ... to ...

Personnel number of the person to be displayed

Company

This selection criterion refers to the company defined in the HR master. All persons are shown that are assigned to the selected company. In general, current HR master data is selected (different versions of the HR master are not supported).

Cost center

The people's cost center according to the HR master. In general, current HR master data is selected (different versions of the HR master are not supported).

Area

The area defined for the people according to the HR master. In general, current HR master data is selected (different versions of the HR master are not supported).

Department

The department defined for the people according to the HR master. In general, current HR master data is selected (different versions of the HR master are not supported).

Last name

Selects by the person's last name according to the HR master. In general, current HR master data is selected (different versions of the HR master are not supported).

Workplace ... to ...

This selection criterion refers to the workplace stored in the machine or workplace master data. The selected workplace is displayed.

Cost center

This selection criterion refers to the cost center stored in the machine and/or workplace master data. The application shows all machines and/or workplaces assigned to the selected cost center.

Group ... to ...

This selection criterion refers to the group stored in the machine or workplace master data. The application shows all workplaces/machines assigned to the selected group.

Company

This selection criterion refers to the company defined in the machine or workplace master data. The application shows all workplaces/machines assigned to the selected company.

Order

Selection by edited orders

Category

This is the order type category.

Planned order

Planned order defined for the order.

Project number

Project number defined for the order.

Sales order

Selects by edited sales orders.

Customer name/designation

Selects by the customer designation defined for the order.

Order group

Selects by the order group defined for the order.

MRP controller

Selects by the MRP controller defined for the order.

Detail Application: Personnel Report

The list only contains data on persons for whom the operator is authorized (authorization via the person's area of responsibility; selection via the current HR master record; no support of versioned HR master records). ONLY individual operations are displayed, not the merged operations themselves, when it comes to merged operations generated at the console.

The requested data is displayed including the following information in a tabular structure:

Person category**Person**

HR master data such as name, operator position, premium indicator, person group, or the person's cost center.

"Logon/logoff" category**Logon/logoff**

Point in time when the person logs on or off.

Workplace category**Workplace**

Workplace to which the person has been logged on as well as the cost center assigned to the workplace.

Order category**Order**

Order/operation number for which the person has produced.

"Primary quantities" category**Target quantity/yield/scrap/unit**

Target quantity of the operation as well as the yield or scrap produced (i.e. recorded) by the person. The latter are gathered from personal postings (record type „B“).

For further information on the personal posting of quantities, please refer to the chapter entry of quantities in the document entitled implementation of HYDRA BDE and MDE .

Please note: Target quantities are not target quantities that are calculated proportionately, but the total quantity to be produced of the operation (please see order information, "quantities" tab)

Durations category**Proportionate labor duration/setup time/processing time/actual setup time/production/downtimes**

The time posted by the person is displayed - distributed according to production time and downtime - in addition to the (target) setup time and the (target) processing time of the operation. If the person is logged on to different orders the labor time accrued for the order is displayed in the column proportionate labor duration (provided that current registrations are considered).

Note: The (target) setup time and the (target) processing time of the operation are not times that are calculated proportionately but values that are displayed in the "Order information" dialog.

Detail application: PivotTable

The detail application "Pivot Table" allows for data to be evaluated and accumulated by further criteria.

By default, all people and their cost center are displayed and compared with each other with respect to the labor utilization rendered at the different cost centers. The "cost center" column refers to the cost center of the workplace to which the people have logged on.

Toolbar

When you call a function or target application, the parameters of the table are always transferred. For this reason, always select an entry to call an application.

Order information (function authorization: orin)
