

1 Target-Oriented Planning

Summary

Menu	Master data → Production control → Target-oriented planning
Transaction code	plstrt
Function authorization	mdplstrt.*

Usage

You use this function to create or modify criteria applied in the system's automatic assignment based on target-oriented planning.

Integration

Priority rules are used during [automatic assignment](#). Using this priority rule, the operations to be planned are rated and indexed by an adjustable weight, and the queue is sorted (prioritized) by this index. Unlike other [sorting rules](#), with this one the actual target is weighted and the assignment adjusted to it.

In order to use a priority rule, it is assigned to a [planning variant](#).

Selection criteria

The application provides the following selection criterion:

Description

A search can also be run using this input field to find the description of rules that were already created. The use of wildcards is supported.

Field descriptions

All of the configured rules are listed on the left in a table.

Strategy

All sorting rules are set up under the identification "TARGET". This is a fixed value that is assigned when a new priority rule is created.

Designation

Detailed information about the priority rule.

Responsibility areas

Responsibility area can be used to control access to the priority rule.

When selecting a rule, each of the assigned target criteria is displayed in the detail view on the right in tabular or graphic form. The target criteria are the basis by which queues are sorted.

Target

This field describes the target that should be included when determining the weighting.

Weighting

A weighting can be defined for the parameters listed above. In addition, you can also set whether the parameter is beneficial or detrimental to the overall weighting. The value of the weighting has no size.

Toolbar

In addition to the icons available for creating, editing and deleting a priority rule, there is also an icon that can be used to call up a dialog, in which you can define each of the weighting parameters.

Edit target definition

To edit weightings, a dialog opens in which you enter the values based on which the weighting should be performed. Weightings greater than 0 are displayed in the chart on the right.

Procedure

To create a priority rule, follow the steps listed below:

1. Create a new profile rule by clicking on the icon *Insert* in the *Functions* category.
2. Choose this priority rule from the list and now click on the icon *Target definition* to define each of the separate weightings. The following weighting parameters can be defined:

Order duration	Scheduled end time of the order minus scheduled start time of the order
Buffer time of the order	Basic finish date of the order minus scheduled end time of the order
Order delay	Scheduled end time of the order minus latest end of the order
Reduction level	Current reduction level defined for the order
Priority	Priority defined for the operation
Variability	Relationship between the order's buffer time to the order's processing time
