

1 Process Status Overview Table

Overview

Menu	Quality management → Process analysis → Process status overview
Transaction code	ppov
Function authorization	ppov

The overview of the process statuses of process parameters and machines is used for process analysis in quality management.

Usage

In this application, the current status of individual characteristics is indicated in accordance with limit value violations. This means the status of the characteristics and/or process parameters is always indicated on the basis of the latest status transmission received. This is also implemented in the form of color highlighting, too. Based on the status of a machine's process parameters, an overall status for the machine is also generated and displayed.

Integration

The application is similar to the Limit value violations application, whereby here only the latest value in time is indicated as the status.

Selection parameters

The following selection criteria are available in the application:

Machine

The desired machine can be selected via the machine pool application.

Process parameters

It is also possible to enter a process parameter.

Event time stamp

By limiting the event time stamp, exact time intervals can be selected.

Violation

In addition, a drop down list can be used to select according to the violation.

Table Detail Application

The table shows all process characteristics of the machines with process data collection. This is limited by the activated selection criteria. Based on the indicated process value violation, a status for the process parameter is formed and an overall status of the machines is generated from all statuses of the machines' process characteristics. The following applies here:

Process parameters

OK:	green display
Action/warning limits violated:	yellow display
Tolerance limits violated:	red display

Overall status of machines

All process parameters OK:	green display
Action limits violated for at least one process parameter:	yellow display
Tolerance limits violated for at least one process parameter:	red display
