

1 Malfunction Tracking

Overview

Menu	Operating facilities management → Status analysis → Malfunction tracking
Transaction code	Sttrck
Function authorization	rsttrck

Malfunction tracking is the ideal tool for any shift foreman and person responsible for production. The statuses of the individual machines are presented as bars in a clear, graphic presentation. The statuses running in parallel are also shown as a drill-down view. In the event of failure of entire lines, it is also possible to perform research into the causes via another detail application.

Usage

The machine time profile is an evaluation function in production management. The machine time profile is used for the timely presentation of the production and standstill behavior of machines in the foreman's area and/or of the selected line over a specified period of time. The profile shows which statuses were recorded at the individual machines at which point in time.

In particular for line analysis purposes, the machines causing the failure of the central aggregate are shown in addition to the machines of the line.

Selection Criteria

The following selection criteria are available in the application:

<Parameter name>

<Description of the result to be expected if the parameter is used>

<Parameter name>

<Description of the result to be expected if the parameter is used>
