

1 Configuration of scheduler entry for the generation of inspection points

Purpose

Using the scheduler, you can define for the generated inspection points whether the inspection interval type is based on *time* or on *piece*.

Requirements

None

Procedure

Create the scheduler job in the MOC in the application *Scheduler*. To call the *Scheduler*, go to:

System administration → System settings → Scheduler

Configure the scheduler entry for the generation of inspection points as follows:

Fields in tab *Command*:

- Type = Standard
- Type = Interval
- Visible = Visible
- Product key = empty
- Active = yes
- License key = empty
- HYDRA User = 0
- Command = sh.exe ./hyqmsipcr.scr
- Commentary = Creation of inspection points

Also configure the interval for the scheduler job. To do so, go to tab *Interval*:

You must restart the HYDRA scheduler service, if you want to use the scheduler job immediately.

In the HYDRA standard, the scheduler checks approx. every 30 minutes if new entries are available in the scheduler. If new entries are available, the entries are called at regular intervals (according to configuration).

If you do not restart the scheduler, it can take up to 30 minutes until HYDRA identifies the new scheduler job.

Result

Using the scheduler process, you automatically generate inspection points and you define if the generation is based on *time* or *piece*.
