1 Energy Management: Consumption Recording PO

Purpose

Application service (AS) including functions for the assignment of recorded consumption values to objects of the shop floor data collection and of the materials management.

You use the function package for the following purposes:

- You want to post consumption as material in relation to the produced articles or orders.
- You want to perform evaluations/reports based on the materials management.
- You want to analyze consumption with reference to the orders produced.

Integration

The application services shop floor data/order data management (BDE-BDM) are licensed. Consequently, the posting and evaluation logics of the relevant services are available. You can add the MOC evaluation functions of the modules shop floor data collection, materials management and energy management. With respect to energy management, this is, for example, the function of the correlative consumption analysis EMG-KLE.

If you require an inventory management including goods movements, which are identified using the automatically collected consumption, then you additionally require the license for the materials and inventory management (MPL-MBV).

Features

- Definition of "material types" for energy consumption
- Assignment of the "material" energy as consumption material in the order data
- Order-related recording and posting of the consumption using the energy counters assigned to the workplaces
- List of the order-related energy consumption based on the consumption that has been recorded and posted as material
- Note: You require separate licenses for MOC functions providing evaluations/reports in the different modules.
