1 Overview: Service Interface for eReports

Purpose

With reports that are available in the system, you can use any client to create reports via a REST interface using the Service Interface for eReports.

You can directly print the reports or store the reports as a file in any file format (PDF, HTML,...) with a configurable file name in configurable paths. A dispatch of the report via e-mail is also possible.

Integration

Requirements for using the Service Interface for eReports:

- The HYDRA eReport Manager (SIS-ERM) has been licensed and installed.
- The basic license *Service Interface (SCS-SIF)* has been purchased and is installed.
- A sufficient number of client licenses for the *Service Interface (SCS-SIC)* has been purchased.
- To send reports via e-mail, the escalation management must be set up. See documentation of the HYDRA eReport Manager.

Features

The Service Interface for eReports is an add-on to the HYDRA eReport Manager (SIS-ERM). You use this add-on to make additional configurations for existing reports and to export reports from the MOC for further processing.

The eReport Manager functions are provided as services of the Web Service Provider (WSP). You can use the HYDRA Service Interface (SCS-SIF) to call these services. Using these services, the reports available in the eReport Manager can be used outside the HYDRA system. The services provide the following functions:

- Identifying the eReport Manager status (online, runtime, ...).
- Listing the available reports (name, ...).
- Reading the information on a specific report (available selection criteria, ...).
- Listing the printers available in the eReport Manager.
- Running a report and passing the selection criteria and the required language with the report.
- Selecting the output format (PDF, HTML, ...).
- Selecting an option for the result: the result can be stored in a file in a HYDRA path, printed or returned as result of the service.
- Selecting the user: you can run the report for the calling user and not for the user defined in the report configuration; the authorizations stored for this user then control the areas of responsibility the user can access.

The services mentioned are subject to the same rules and security aspects as all other services of the Service Interface.

2 Using the Service Interface for eReports

2.1 Requirements

2.1.1 Reports

You must familiarize yourself with reports. You can use the reports that are included in the standard delivery of the system. But you can also create own reports. If you want to create own reports, you require the development tool to create reports (MDS-BAS, MDS-RPD, ...) and the relevant training (CUT-RPD, CUT-MOC, CUT-MDP).

2.1.2 Service Interface

The services of the "Service Interface for eReports" are called using the service interface SCS-SIF. The Service Interface must be licensed. You must familiarize yourself with the use of the Service Interface and connect your client to the system.

The following services are used to control the "Service Interface for eReports":

- PrintService.state
- PrintService.listPrinters
- PrintService.listReports
- PrintService.reportMetaById or PrintService.reportMetaByName
- PrintService.report

For a detailed description of the services, refer to the technical documentation of the Service Interface SCS-SIF. For example, you can use the MPDV Repository Client MRC to view this documentation.

2.1.3 eReport Manager

You require the eReport Manager SIS-ERM to use the "Service Interface for eReports". To make the reports available for the "Service Interface for eReports", some functions of the eReport Manager are required:

- Exporting the report
- Via report configurations in the eReport Manager, you can preconfigure the selection criteria and options for the report output.
- Using the eReport Manager, a GUI is available to test the reports and the report configurations.

Make sure that the eReport Manager SIS-ERM is correctly and completely installed according to the installation instruction. Familiarize yourself with the operation of the eReport Manager.

2.1.4 Optional: Escalation Management

If you want to send reports via e-mail, you require the eReport Manager and additionally you must make configurations in the escalation management for sending e-mails. For a description of the configurations, refer to the [installation instruction of the eReport Manager](#).

- When you install the eReport Manager, you must create an escalation configuration *ESK.MESSAGE*.
- You must properly activate the escalation management in the HYDRA basic settings. To do so, define an e-mail server (SMTP server) and a sender for the e-mails.

2.2 Useful services

The "Service Interface for eReports" includes some services that you can use to get information.

2.2.1 Getting the status of the eReport Manager

Use the service **PrintService.state** to get information on the current status of the "Service Interface for eReports".

The technical service documentation includes a detailed description of the service.

2.2.2 Listing available reports

Use the service **PrintService.listReports** to get a list of all reports that are available for the "Service Interface for eReports".

The technical service documentation includes a detailed description of the service.

2.2.3 Listing available printers

Use the service **PrintService.listPrinters** to get a list of all printers that are available for the "Service Interface for eReports".

The technical service documentation includes a detailed description of the service.

2.3 How to proceed

2.3.1 Exporting and configuring a report on the MOC

When you configure the report, you must make sure that the option to save the report on the server is activated.

The required reports must be exported.

All reports that are exported and saved on the server are available for the "Service Interface for eReports". But we recommend to additionally create configurations in the eReport Manager to configure the selection criteria and the options for the report output. Using the eReport Manager, you can also test the reports and the report configurations.

The [product documentation of the eReport Manager](#) describes how to proceed to export, configure and test reports.

2.3.2 Requesting meta data for a report

On your client, you can request the meta data for a report.

Use the service **PrintService.listReports** to get a list of all reports that are available for the "Service Interface for eReports".

The technical service documentation includes a detailed description of the service.

The service **PrintService.listReports** lists all available reports. If a configuration for a report exists in the eReport Manager, the numeric ID of the configuration is included in the list.

There are two services to request meta data. One service only delivers meta data on the exported report without integrating the configuration settings stored in the eReport Manager. With the other service, the configuration settings stored in the eReport Manager are also integrated in the meta data.

Service PrintService.reportMetaById	Service PrintService.reportMetaByName
The configuration ID in the eReport Manager is used for selection. The configuration must exist.	The name of the exported report is used for selection.
The meta data is preassigned using the exported report and the configuration stored in the eReport Manager.	The meta data is only derived from the exported report.

Use the service **PrintService.reportMetaById** to get the meta data of a report with configuration in the eReport Manager.

Use the service **PrintService.reportMetaByName** to get the meta data of a report without configuration in the eReport Manager.

The service documentation includes a detailed description of both services.

2.3.3 Changing meta data

Change the meta data.

Usual changes:

- Changes of the selection criteria
- Specifications on the output or the dispatch of the report

The meta data that you can change is described in the technical documentation of the service **PrintService.report**.

2.3.4 Creating a report

Use the service **PrintService.report** to create the report.

The technical service documentation includes a detailed description of the service.

Pass the previously requested and possibly changed meta data to the service **PrintService.report** in the parameter `print.service.report.meta`.

2.3.5 Result

The result depends on the settings in the meta data:

- The file format (PDF, HTML,...) is defined in the meta data.
- The file is stored in the specified path. (Note: the path is not directly specified as directory, but only the name of a path configuration in the system).
- The service returns the file with Base64 encoding in the service parameter `print.service.report`.
