1 Sending of Escalation Messages by SMS

Fields of application

The function package SIS-VES provides functions by way of which notifications from escalation management can be sent to a third-party software by e-mail to have these messages sent by the external software by SMS.

Implementation notes

You use the function package SIS-VES, if you:

- use the function package SIS-ESK (escalation management – basic/framework) and you wish to send the messages also by SMS, apart from the notifications by e-mail or in the MES itself.

The function package helps you send the messages in real time to the recipients of escalations and, as a result, to shorten your internal and/or external processes.

The function package allows to send e-mails and SMS as a part of the escalation management either separately or at the same time.

Integration

The function package is based on the HYDRA escalation management (SIS-ESK) and enhances this one by the function for sending text messages (SMS).

Features

The function package provides the following functions:

- Configuration of an SMTP path for a connection to the third-party software based on SMTP
- Storage of a mobile phone number for the recipient in the HYDRA HR master
- Provision of the messages to be sent as SMS by e-mail for the third-party software

2 SMS Dispatch

Mapping

SMS are sent by an SMS gateway (software by third-party) to which escalations are forwarded by SMTP. The SMS gateway is provided with the mobile phone number of the determined recipient in the subject line and with the message to be sent included in the message text.

The original subject line of the escalation is overwritten. The SMS gateway might be required to shorten the message text to be transferred due to possible technical restrictions of the SMS communication service.

The mail address defined in the basic settings is used as the return address (just as it is the case for e-mails).

- If required, the SMS gateway shortens the text to a maximum length. Consequently, important information might get lost. For this reason, customers should adjust escalation texts, if necessary, so as for the relevant information of an escalation to be written at the beginning of the message text.

It is recommendable to enter the most important information of the message at the beginning to prevent important text from being cut off or to keep the sense and information content.

3 Application-Relevant Settings in HYDRA

Maintenance of the SMS path

A path defined in HYDRA establishes the connection between escalation management and the mail server that has been designed as the connecting link to the SMS gateway. Maintain the following entry in the [HYDRA path configuration](#):

Parameter name	Value
Path	SMSGW
Schema	smtp
Host	Name of the SMTP server or its IP address, e.g. mailserver.firma.intern
Port	Port of the SMTP server. "0" means that the standard SMTP port is to be used.
URL path	Target address of the SMS gateway, e.g. msggateway@firma.com
User	User name is not required, remains empty
Password	Password is not required, remains empty
Comment	SIS-VES: Sending of SMS by Gateway

Maintenance in the basic parameter settings – assignment of the SMS path

The entry for the SMS path kept in the [HYDRA path configuration](#) has to be defined in the escalation management configuration of the [HYDRA basic parameter settings](#):

Parameter name	Value
SMS path	SMSGW

HR master maintenance

A mobile phone number has to be stored in the [HR master](#) for every recipient that is to be notified by SMS. The format in which the number is to be defined depends on the requirements of the mail server or SMS gateway (both software by third-parties).

Parameter name	Value
Mobile phone number, company	Phone number in the relevant format
