1 Available Escalations

1.1 Summary

HYDRA escalation management provides a framework of functions for forwarding events occurring or entered in HYDRA to individual users or user groups in real time. In this context, the escalation management actively undertakes notification steps.

After sending a notification, escalation management supervises the time taken by the notified person to acknowledge the notification and the time up to the completion of the escalation. Escalations can be forwarded to other users or user groups during processing.

The present documentation describes the existing escalations of MPL and TRT.
