1 Installation SQL Server 2019 SE

Attention:

To perform the following procedures advanced knowledge of your server operating system, the intended database software and common IT systems is required.

These procedures are performed on your own responsibility.

MPDV Mikrolab GmbH is not liable for any loss of or destruction of data.

In case of doubt place an order with MPDV Mikrolab GmbH to perform these tasks for you.

This manual explains how to install Microsoft SQL Server 2019 Standard Edition for use with MPDVs Manufacturing Integration Platform (**MIP**) based products like MIP 1.1, HYDRA MW4.0pe or FEDRA 1.1.

Other than MIP the applications HYDRA and FEDRA allow for a multi system installation (multiple HYDRA or FEDRA systems on the same (application) server).

For multi system installations every HYDRA or FEDRA system needs its own database.

Name your databases **mip1**, **mip2**, **mip3**, etc.

With multi system installations it is strongly recommended that every database has its own database instance available, e.g.: **MIPMS1**, **MIPMS2**, **MIPMS3**, etc.

Attention: Do not run these installation procedures on a computer where MIP based products like MIP 1.1, HYDRA MW4.0pe or FEDRA 1.1 are already running.

By doing so, you might destroy your existing MIP based system.

Please be extremely cautious if you decide to do it anyway.

1.1. Installation Requirements

- Server hardware and software according to the recommendations of MPDV Mikrolab GmbH for the respective MIP based product.
See manuals: **HW_SW_GUIDE.pdf**
- English or German Windows operating system according to the recommendations of MPDV Mikrolab GmbH.
- Server configuration according to MPDVs server configuration manuals for the respective MIP based product, e.g.:
"Preparation Guide for Windows Server 2016" (e.g.: PreInstGuide_MW40_WIN2016.pdf)
"Preparation Guide for Windows Server 2019" (e.g.: PreInstGuide_MW40_WIN2019.pdf)
- Installation DVD or installation files for the required edition of **"SQL Server 2019"**, e.g. for Standard Edition, e.g.:
English: **en_sql_server_2019_standard_x64_dvd_c7d70add.iso**
German: **de_sql_server_2019_standard_x64_dvd_2cd4ee21.iso**
- Installation files for the Microsoft **SQL Server Management Studio (SSMS)** matching the language of your operating system, e.g.:
English: **SSMS-Setup-ENU.exe**
German: **SSMS-Setup-DEU.exe**
(SQL Server Management Studio is no longer included in the installation DVD of the SQL Server!)
- The language versions of the operating system and the database must match!
- Service Pack (**SP**) and Cumulative Update Package (**CP**) installation files for SQL Server 2019 mandatory for the respective MIP based product:
Service Pack (**SP**): currently there is no SP installation mandatory for MIP, HYDRA or FEDRA (only if the required SP is not already included in the original installation file or DVD)
Cumulative Update Package (**CP**): currently there is no CP installation mandatory for MIP, HYDRA or FEDRA

- Minimum hard disk configuration:
Partition **C:** with a minimum of **100 GB** disk space available and file system **NTFS**.
Partition **D:** with a minimum of **600 GB** disk space available and file system **NTFS**.
For more details please see the server configuration manual.
- For better performance it is recommended to have at least two hard disks available:
Disk 1 with partition **C:** (≥ 100 GB) and **D:** (≥ 200 GB) (for Windows and applications)
Disk 2 with partition **E:** (≥ 400 GB) (for database files)
For more details please see the server configuration manual.
- The Windows desktop resolution should be set to **1920 x 1080** at least to **1280 x 1024** (see server configuration manual).
- Local Windows user **mipadm** (see server configuration manual).
The user **mipadm** must be member of the local group **Administrators**.
- Activated Feature: **.NET Framework 3.5**
Windows-Button → Server Manager → Manage → Add Roles and Features

To add this feature the directory **x:\sources\sxs** from the Windows installation DVD is needed!
(see server configuration manual)

- With **separate MIP based application and database servers** it is mandatory to install additional software on the **application server**.
Please see chapter "[1.7. Separate Database and Application Server](#)".

1.2. Installing SQL Server 2019

Login as local user **mipadm**.

Insert the SQL Server installation disc or mount the installation file, e.g.:

en_sql_server_2019_standard_x64_dvd_c7d70add.iso

If the installation is not starting automatically start it manually by double clicking **setup.exe**.

Please proceed with the installation as described below:

SQL Server 2019

Please wait while Microsoft SQL Server 2019 Setup processes the current operation.

Planning

Select: **System Configuration Checker**

SQL Server 2019

Please wait while Microsoft SQL Server 2019 Setup processes the current operation.

There should be no warnings or errors

OK

Installation

Select: **New SQL Server stand-alone installation or add features to an existing installation**

SQL Server 2019

Please wait while Microsoft SQL Server 2019 Setup processes the current operation.

The screenshot shows the 'Product Key' window of the SQL Server 2019 Setup. The window title is 'SQL Server 2019 Setup'. The main heading is 'Product Key' with the instruction 'Specify the edition of SQL Server 2019 to install.' On the left is a navigation pane with the following items: Product Key (selected), License Terms, Global Rules, Microsoft Update, Product Updates, Install Setup Files, Install Rules, Feature Selection, Feature Rules, Feature Configuration Rules, Ready to Install, Installation Progress, and Complete. The main area contains a text block explaining that the user should validate the instance by entering a 25-character key from the Microsoft certificate of authenticity or product packaging, or specify a free edition (Developer, Evaluation, or Express). Below this, there are two radio buttons: 'Specify a free edition:' (unselected) and 'Enter the product key:' (selected). Under 'Specify a free edition:', there is a dropdown menu currently showing 'Evaluation'. Under 'Enter the product key:', there is a text box containing the key 'PMBDC-FXVM3-T777P-N4FY8-PKFF4'. At the bottom right are three buttons: '< Back', 'Next >' (highlighted with a blue border), and 'Cancel'.

Enter your product key (if necessary)

Next

Activate: I accept the license terms

Next

If your server has no access to the internet you will see a message like this:

Next

If your server has access to the internet you will see the following message:

Activate: Use Microsoft Update to check for updates (recommended)

Next

If there are SQL Server product updates available you might want to include them in your installation:

Next

There should be no errors or warnings:

Possible warnings for "Windows Firewall" which is supposedly active but actually isn't, can be ignored.

Next

Select the features to be installed: **Database Engine Services**

Select Instance root directory, e.g.: **D:\SQLServer** (when using 1 hard disk)
E:\SQLServer (when using 2 or more hard disks)

Next

Instance Configuration

Specify the name and instance ID for the instance of SQL Server. Instance ID becomes part of the installation path.

Server Configuration Data Directories **TempDB** MaxDOP Memory FILESTREAM

TempDB data files: tempdb.mdf, tempdb_mssql_#.ndf

Number of files: 4
Initial size (MB): 400
Autogrowth (MB): 400

Total initial size (MB): 1600
Total autogrowth (MB): 1600

Data directories: E:\SQLServer\MSSQL15.MIPMS1\MSSQL\Data

TempDB log file: templog.ldf

Initial size (MB): 400
Autogrowth (MB): 200

Log directory: E:\SQLServer\MSSQL15.MIPMS1\MSSQL\Data

< Back Next > Cancel

TempDB data files:

Number of files: 4 (Default, do not use less than 4 files!)

Initial size (MB): 400

Autogrowth (MB): 400

Data directories: change only if necessary,
e.g. to place TempDB data files on separate disks

TempDB log file:

Initial size (MB): 400

Autogrowth (MB): 200

Log directory: change only if necessary,
e.g. to place TempDB log file on a separate disk

Select Tab": MaxDOP

MaxDOP

Check the setting for “**Maximum degree of parallelism (MaxDOP)**” which was calculated by Setup.

Make sure it is set to a value of at least 4

If the calculated value is higher than 4 you may leave it that way.

Select Tab: **Memory**

Change radio button from Default to **Recommended**:

Min Server Memory (MB): 0

Max Server Memory (MB): adjust according to the statement below

(Note that the displayed recommended value does not consider the following circumstances and might need to be adjusted accordingly)

Depending on the total amount of RAM memory available on the server and the system requirements by the MIP based product please set the size for "Max Server Memory (MB)" so that as much memory as possible will be used by the database instance.

The size of "Max Server Memory (MB)" will have direct influence on the performance of the MIP based application because with bigger sizes more data can be cached by the database.

As long as it is ensured that there will be enough RAM left for the requirements of the server's operating system (~2GB), the MIP based product services (depending on the system size ~1,5-8GB per system), the MIP WSP service (depending on the system size ~2-12GB per system) and other database instances installed on the same server you should use as much memory for "Maximum Server Memory" as possible.

Make sure that the available server memory (RAM) is used to full capacity without forcing your server into swapping.

Activate the checkbox to accept the recommended memory configurations for the SQL Server Database Engine

Select Tab: FILESTREAM

FILESTREAM

no changes necessary

Verify the SQL Server features to be installed

Install

Make sure the installation succeeded successfully

Close

Close this Window

For HYDRA or FEDRA multi system installations repeat the installation procedures to add additional database instances (see also next chapter).

1.2.1. Installing additional Database Instance

Other than MIP the applications HYDRA and FEDRA allow for a multi system installation (multiple HYDRA or FEDRA systems on the same (application) server).

For multi system installations every HYDRA or FEDRA system needs its own database.

Name your databases **mip1**, **mip2**, **mip3**, etc.

With multi system installations it is recommended that every database has its own database instance available, e.g.: MIPMS1, MIPMS2, MIPMS3, etc.

Start an installation as described in chapter [“1.2. Installing SQL Server 2019”](#)

To install a new instance of SQL Server please proceed as follows:

Installation Type
Perform a new installation or add features to an existing instance of SQL Server 2019.

☒ **Perform a new installation of SQL Server 2019**
Select this option if you want to install a new instance of SQL Server or want to install shared components.

☐ **Add features to an existing instance of SQL Server 2019**
MIPMS1
Select this option if you want to add features to an existing instance of SQL Server. For example, you want to add the Analysis Services features to the instance that contains the Database Engine. Features within an instance must be the same edition.

Installed instances:

Instance Name	Instance ID	Features	Edition	Version
MIPMS1	MSSQL15.MIPMS1	SQLEngine	Standard	15.0.2000.5

< Back **Next >** Cancel

Perform a new installation of SQL Server 2019

Close this Window

1.3. Installing SQL Server Management Studio

Start the Installation of the SQL Server Management Studio.

Make sure you have the installation file matching the language of your servers operating system available, e.g.:

SSMS-Setup-ENU.exe

If the version of your SQL Server Management Studio is **higher than version 17** and if you are using **separate application and database servers** for your MIP based product you need to follow the instructions in chapter "[1.7. Separate Database and Application Server](#)".

Install

Close

Depending on the installation you might see a message where a restart of the server is required.

Restart

If it is requested restart your server now.

1.4. Installing Service Pack

Currently there is no Service Pack installation mandatory for MIP based products.

1.4.1. Installing Cumulative Update Package

Currently there is no Cumulative Update Package installation mandatory for MIP based products.

1.5. Post Installation Configuration

Start the “SQL Server 2019 Configuration Manager”, e.g.:

Start-Button – Microsoft SQL Server 2019 – SQL Server 2019 Configuration Manager

In “SQL Server Network Configuration” the protocols **Shared Memory**, **Named Pipes** and **TCP/IP** must be enabled for all available database instances, e.g.: MIPMS1, MIPMS2, etc.:

Start the “SQL Server Management Studio”, e.g.:

Start-Button – Microsoft SQL Server Tools 18 – Microsoft SQL Server Management Studio

Login to the appropriate database instance (e.g.: MIPMS1) as User “sa”:

Server name: <hostname>\MIPMS1

Authentication: SQL Server Authentication

Login: sa

Password: <SECRET sa PASSWORD> (see chapter “[1.2. Installing SQL Server 2019](#)”)

Connect

Right click on <hostname>\MIPMS1

Select: Properties

Memory (you should see the values you entered during the installation, see above)

Minimum server memory (in MB): 0

Maximum server memory (in MB): as much as available

Depending on the total amount of RAM memory available on the server and the system requirements by MIP based products please set the size for “Maximum server memory” so that as much memory as possible will be used by the database instance.

The size of “Maximum server memory” will have direct influence on the performance of the MIP based application because with bigger sizes more data can be cached by the database.

As long as it is ensured that there will be enough RAM left for the requirements of the server’s operating system (~2GB), the MIP based product services (depending on the system size ~1,5-8GB per system), the MIP WSP service (depending on the system size ~2-12GB per system) and other database instances installed on the same server you should use as much memory for “Maximum server memory” as possible.

Make sure that the available server memory (RAM) is used to full capacity without forcing your server into swapping.

Advanced

Optimize for Ad hoc Workloads **True**

Cost Threshold for Parallelism **40**

Max Degree of Parallelism **4** or higher (see MaxDOP during the installation above)

OK

Repeat those configurations for every database instance.

Start-Button – Windows Administrative Tools – Services

The following 3 SQL Server services are required by MIP based products.

A running service “**SQL Server Browser**” is mandatory for the functionality of MIP based products.

Check that those services are starting automatically:

Example for a multi system installation:

Restart your server now.

1.6. Database

Other than MIP the applications HYDRA and FEDRA allow for a multi system installation (multiple HYDRA or FEDRA systems on the same (application) server).

For multi system installations every HYDRA or FEDRA system needs its own database.

Name your databases **mip1**, **mip2**, **mip3**, etc.

With multi system installations it is strongly recommended that every database has its own database instance available, e.g.: **MIPMS1**, **MIPMS2**, **MIPMS3**, etc.

Before you can proceed with creating a database to be used by the MIP based product you need to have the following files available:

db_mip_sql2019.sql (or **db_mip_sql2019.bsp**)
create_user_mipadm_sql201x.sql

Either those files were provided to you in advance by MPDV or you might have installation packages for the MIP based application available.

In the MIP package the files are located in the “.\Database” directory.

In the HYDRA or the FEDRA package the files are located in the “.\db_sql” directory.

1.6.1. Create Database

Attention:

Do not run these installation procedures on a computer where MIP based products are already running.

By doing so, you might destroy your existing MIP based system.

Please be extremely cautious if you decide to do it anyway.

Logon to the (database) server as local user “mipadm”.

Check if the database creation script **db_mip_sql2019.sql** is available in the above mentioned directories.

If not, make a copy of the file **db_mip_sql2019.bsp**, e.g.:

```
copy d:\mip1\db_sql\db_mip_sql2019.bsp d:\mip1\db_sql\db_mip_sql2019.sql
```

Edit the database creation script and make sure that all path configurations are set corresponding to your system environment, e.g.:

```
FILENAME=N'E:\SQLServer\MSSQL15.MIPMS1\MSSQL\DATA\rootdbs_Data.MDF'
```

All paths used in the database creation script must exist on your server before running the script!

Do not change or remove settings regarding user configurations and authorizations or any other permissions without consulting with MPDV first!

By doing so it might be possible that the MIP based product will not work properly.

Create a backup copy of the edited database creation script **db_mip_sql2019.sql**, e.g.:

```
copy d:\mip1\db_sql\db_mip_sql2019.sql d:\mip1\db_sql\db_mip_sql2019_mip1.sql
```

Start the “SQL Server Management Studio”, e.g.:

Start-Button – Microsoft SQL Server Tools 18 – Microsoft SQL Server Management Studio

Login to the appropriate database instance (e.g.: MIPMS1) as User “**sa**”:

Server name: **<hostname>\MIPMS1**

Authentication: **SQL Server Authentication**

Login: **sa**

Password: **<SECRET sa PASSWORD>** (see chapter “[1.2. Installing SQL Server 2019](#)”)

Connect

Open the database creation script (e.g. db_mip_sql2019.sql) in menu “File → Open → File...”

Select file, e.g.: d:\mip1\db_sql\db_mip_sql2019.sql

Attention:

The database creation script will delete an existing database (Default: “mip1”) before creating a new one. If you perform the following procedures on a server where there are already MIP based databases installed you might destroy your existing MIP based system.

Execute

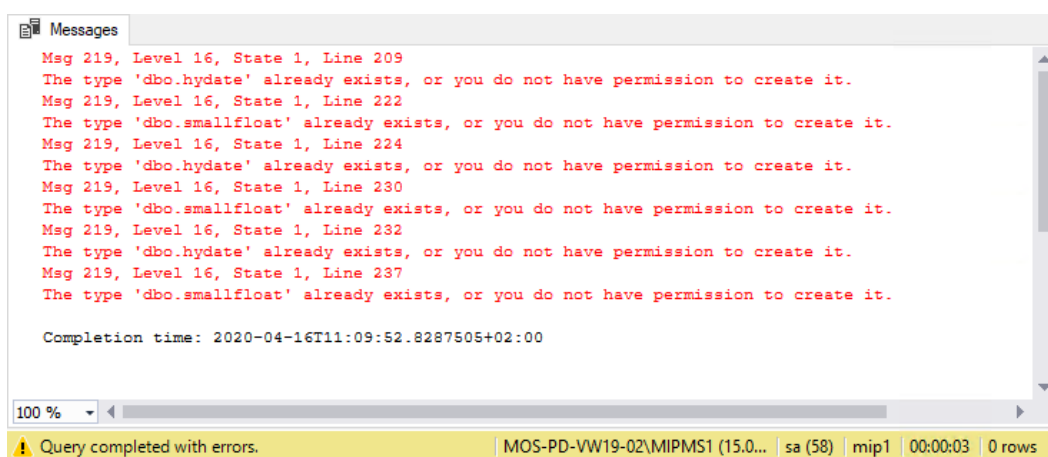

The database creation must complete without errors:

→ Commands completed successfully

If a MIP based database was already created earlier on this server there will be error messages about user defined data types "dbo.hydate" and "dbo.smallfloat" which already exist.

In this case the following messages can be ignored:

To avoid those error messages you might want to delete the user defined data types first before running the database creation script again.

In this case use the following commands:

```
USE model
```

```
DROP TYPE hydate;
```

```
DROP TYPE smallfloat;
```

```
USE tempdb
```

```
DROP TYPE hydate;
```

```
DROP TYPE smallfloat;
```

```
USE mip1
```

```
DROP TYPE hydate;
```

```
DROP TYPE smallfloat;
```

Close session:

File → Close

Repeat these procedures for every additional database instance (e.g.: MIPMS2) and its database (e.g.: mip2).

The database creation script “db_mip_sql2019.sql” needs to be duplicated and adjusted accordingly.

Make sure to save a copy of the new script using a unique file name, e.g.:

d:\mip1\db_sqlldb_mip_sql2019_mip2.sql

1.6.2. Create Database User

Note about database user name “mipadm”:

MPDV strongly recommends not to change the default database user name “mipadm”!

If you decide to change it anyway it is mandatory that the names of the database user and the database schema **are always identical!**

If the database user name needs to be different than “mipadm” the schema name has to be changed accordingly.

At present only characters “a-z” and “0-9” are allowed!

Upper case characters are **not** allowed!

Note about password for database user “mipadm”:

It is possible to use different passwords than MPDVs default password.

For security reasons MPDV strongly recommends to change the default password used for the database user “mipadm” as soon as the user is successfully created (see below).

The new password must be disclosed to MPDV.

The following characters are **not** allowed for the password:

- Characters with ASCII Code > 126 (e.g. German umlauts, French “umlauts”, etc.)
- Pipe: |
- Ampersand: &

Do not change or remove settings regarding user configurations and authorizations or any other permissions without consulting with MPDV first!

By doing so it might be possible that the MIP based product will not work properly.

Make sure that no other sessions are open before running the script.

Open database user creation script (create_user_mipadm_sql201x.sql) in menu

“File → Open → File...”

Select file, e.g.: d:\mip1ldb_sql\create_user_mipadm_sql201x.sql

For security reasons MPDV strongly recommends to change the password for the database user “mipadm” as soon as the user is successfully created (see below).

If you decide to change the password directly here in the SSMS window make sure not to save the user creation script afterwards which then will contain the supposedly secret password in plain text!

Execute

The user must be created without errors:

→ Commands completed successfully

For security reasons MPDV strongly recommends to change the password for the database user "mipadm" as soon as the user is successfully created (see above).

To change a user's password use the following commands:

```
USE master
```

```
ALTER LOGIN login_name WITH PASSWORD = 'password'
```

e.g.:

```
USE master
```

```
ALTER LOGIN mipadm WITH PASSWORD = 'NewSecurePW'
```

The new password must be disclosed to MPDV.

If the user “mipadm” was already created earlier on this server the following messages can be ignored when executing the user creation script again:

To avoid those error messages you might want to delete schema, user and login first before running the user creation script again.

In this case use the following commands:

```
USE mip1
drop schema mipadm
drop user mipadm
drop login mipadm
GO
```

Repeat these procedures for every additional database instance (e.g.: MIPMS2) and its database (e.g.: mip2).

The user creation script “create_user_mipadm_sql201x.sql” needs to be duplicated and adjusted accordingly. Make sure to save a copy of the new script using a unique file name, e.g.:

```
d:\mip1ldb_sql\create_user_mipadm_sql201x_mip2.sql
```

1.6.3. ODBC Configuration

Start-Button – Windows Administrative Tools – ODBC Data Sources (64-bit)

Select: **System DSN**

Select: **Add**

Select: **SQL Server Native Client 11.0**

Finish

Name: **MIPSQL1** (mandatory for MIP based products, e.g. for HYDRA system 1)

(use MIPSQL2, MIPSQL3, etc. for additional HYDRA systems)

Description: **MIP1 Database**

Server: **<hostname>\MIPMS1**

(<hostname> = hostname or IP-address of the MIP based products (database) server)

Next

Select: **With SQL Server authentication using a login ID and password entered by the user**

Login ID: **mipadm** (see chapter "[1.6.2 Create Database User](#)")

Password: **<SECRET mipadm PASSWORD>** (see chapter "[1.6.2 Create Database User](#)")

Next

Create a New Data Source to SQL Server

☒ Change the default database to:
mip1

Mirror server:

SPN for mirror server (Optional):

☐ Attach database filename:

☒ Use ANSI quoted identifiers.
☐ Use ANSI nulls, paddings and warnings.

Application intent:
READWRITE

☐ Multi-subnet failover.

< Back Next > Cancel Help

Change the default database to: **mip1**
(select mip2, mip3, etc. for additional HYDRA systems)

Activate: Use ANSI quoted identifiers

Deactivate: Use ANSI nulls, paddings and warnings

Application intent: **READWRITE**

Next

Create a New Data Source to SQL Server

☐ Change the language of SQL Server system messages to:
(Default)

☐ Use strong encryption for data

☐ Perform translation for character data

☐ Use regional settings when outputting currency, numbers, dates and times.

☐ Save long running queries to the log file:
C:\Users\mipadm\AppData\Local\Temp\2\QUERY. Browse...

Long query time (milliseconds): 30000

☐ Log ODBC driver statistics to the log file:
C:\Users\mipadm\AppData\Local\Temp\2\STATS.I Browse...

< Back Finish Cancel Help

Deactivate all!

Finish

Test Data Source

Make sure the connectivity tests completed successfully:

OK

OK

Repeat these procedures for every additional database and database instance.

Use Data Source Names: **MIPSQ2, MIPSQ3, etc.**

Example for a multi system installation:

1.6.4. Remap Database User to SQL Server Login

After restoring a database “mip1” it might be necessary to remap the database user “mipadm” to the SQL Server login “mipadm” by using one of the following commands:

According to Microsoft the procedure “sp_change_users_login” is currently in maintenance mode and may be removed in a future version of Microsoft SQL Server.

```
sp_change_users_login 'update_one', 'username', 'loginname'
```

```
use mip1
```

```
sp_change_users_login 'update_one', 'mipadm', 'mipadm'
```

```
go
```

Microsoft recommends to use the command “ALTER USER” instead, e.g.:

```
use mip1
```

```
ALTER USER mipadm WITH LOGIN = mipadm
```

```
go
```

1.7. Separate Database and Application Server

With **separate application and database servers** for MIP based products the following software is needed on the MIP based application server and must **always** be installed on the **application server**.

The SQL Server Native Client is needed by MIP based products to connect to its database.

The following SQL Server tools are mandatory for several MIP, HYDRA or FEDRA functionality:

bcp.exe (needed by hy2exp.exe, hy2imp.exe and PDV 8.3)

sqlcmd.exe (needed by hy_diff_mw4.scr)

Please make always sure that the SQL Server tools **bcp.exe** and **sqlcmd.exe** are available on the **application server** of your MIP based product!

Those tools are part of the “SQL Server Management Studio” installation package as long as the version of your SSMS is not higher than version 17.

If using a SSMS version >17 you need to install the 64-Bit version of the “**Microsoft Command Line Utilities 14.0 for SQL Server**”, e.g. to be download from:

<https://www.microsoft.com/en-us/download/details.aspx?id=53591>

The Microsoft Command Line Utilities requires an already installed 64-Bit version of the “**Microsoft ODBC Driver 13.1 for SQL Server**”, e.g. to be download from:

<https://www.microsoft.com/en-us/download/details.aspx?id=53339>

Proceed with the installation as described below.

1.7.1. Installing SQL Server Client

On the **application server** of your MIP based product start the installation as described in chapter “[1.2. Installing SQL Server 2019](#)”.

Choose the feature “**Client Tools Connectivity**” to install:

Next

Install

Close

1.7.2. ODBC Configuration

Always perform the ODBC configuration on the **application server** of your MIP based product as described in chapter "[1.6.3. ODBC Configuration](#)".

1.7.3. Installing SQL Server Management Studio

Always install the "SQL Server Management Studio" on the **application server** of your MIP based product as described in chapter "[1.3. Installing SQL Server Management Studio](#)".

If the version of your SQL Server Management Studio is **higher than version 17** you need to proceed with the following chapters.

1.7.4. Installing Microsoft ODBC Driver 13.1

The Microsoft Command Line Utilities require an already installed 64-Bit version of the “**Microsoft ODBC Driver 13.1 for SQL Server**”, e.g. to be download from:

<https://www.microsoft.com/en-us/download/details.aspx?id=53339>

Depending on the language setting of your application server execute one of the following files:

msodbcsql_de.msi or **msodbcsql_en.msi**.

Next

I accept the terms in the license agreement

Next

Next

Install

Finish

1.7.5. Installing Microsoft Command Line Utilities

If using a SSMS version >17 you need to install the 64-Bit version of the “**Microsoft Command Line Utilities 14.0 for SQL Server**”, e.g. to be download from:

<https://www.microsoft.com/en-us/download/details.aspx?id=53591>

Execute the file **MsSqlCmdLnUtils.msi**.

Next

I accept the terms in the license agreement

Next

Install

Finish

Please make always sure that the SQL Server tools **bcp.exe** and **sqlcmd.exe** are available on the **application server** of your MIP based product!

bcp.exe (needed by hy2exp.exe, hy2imp.exe and PDV 8.3) should now be available, e.g. in:

c:\Program Files\Microsoft SQL Server\Client SDK\ODBC\130\Tools\Binn\bcp.exe

sqlcmd.exe (needed by hy_diff_mw4.scr) should now be available, e.g. in:

c:\Program Files\Microsoft SQL Server\Client SDK\ODBC\130\Tools\Binn\SQLCMD.EXE
