

1 Personnel Shift Log

Overview

The personnel shift log is a function in production management. This function allows for a shift evaluation with the capability of creating a personal detailed report. The shift supervisor, the shift manager and the foreman are each provided a clear overview of all of the information needed relating to his staff.

Integration

The personnel shift log provides information about the operations completed during a shift. In addition to the quantities produced, the log also shows the time that was required in each case. This is shown for each person logged on at the operation. The data displayed is the result of the order-related data entered at the terminal during posting.

Requirement

In order to use the personnel shift log, what is required is that personnel-related postings are performed and that corresponding finished postings (log records) exist in the system.

Selection criteria

Shown in the personnel shift log are all operations that were selected in the selection panel. Here, the BDE log records of selection type "B" are considered. The application provides the following selection criteria:

Workplace from ... to ...

Select the log records posted to the *workplace* that was entered, the responsibility area of which the user has authorized rights to. You can also run a search using wildcards in the field.

Group from ... to ...

Select the log records posted to the *workplace* that was entered, the responsibility area of which the user has authorized rights to, and that are assigned to the entered group. You can also run a search using wildcards in the field.

Cost center

Select the log records posted to the *people*, the responsibility area of which the user has authorized rights to and that are assigned to the entered cost center.

Date from ... to ...

The time period entered restricts the selection by log records. Select the log records that have a posted shift date within the defined period.

The preset value is "Today minus 7 days" to "Today". The date is calculated based on the Gregorian calendar.

Shift all, 1, 2, 3, 4

Within the entered period, only those log records are selected that are assigned to the shift entered according to the shift model.

Operations that are logged on during the currently running shift at the time the data are selected are not considered, because no log records have been generated for them yet.

Personnel shift log

The following fields are displayed in the table:

Shift date

Shift date of the shift in which the operation is completed.

Shift

Shift in which the operation is completed. In the process, the shift number is determined based on the shift that is active at the time of posting, as defined in the shift model, for the workplace at which the operation is logged in.

Person

Personnel number of the person logged on at the operation. The personnel number is displayed with leading zeros.

Last name

Last name of the person logged on at the operation.

First name

First name of the person logged on at the operation.

Order

Order number of the order/ operation.

Operation

Operation number for the operation

Article

Article number of the operation.

Production

The time of production (RPA 11) entered for this operation in relationship to the selected shift.

Total time

Sum total of all production and standstill periods (sum of RPA 1 - 11). The separate RPAs are listed after the recorded quantities.

Yield

The yield entered for this operation in relationship to the selected shift.

Scrap

The scrap posted for this operation in relationship to the selected shift.

Unit

The relevant unit of quantity.

SUT

Secondary utilization time

DCI

Disturbance-caused interruption

LCI

Logistics-caused interruption

SCI

Staff-caused interruption

IMN

Idle mode (not scheduled)

IMS

Idle mode (scheduled)

SET

Setup

STA

Startup

U8

User RPA

U9

User RPA

MUT

Main utilization time

Operation designation

Operation designation for the operation

MES order number

Combined order/ operation number.

Please note:**Displaying the actual quantity and the actual durations (RPA)**

For workplaces that are either not assigned to any terminal or for those that are assigned to a terminal configured as a BDE terminal, there is no shift automation. This means that there are no automatic order or person-related postings at the end of shifts. Because this means that there is also no exact shift relationship to the entered quantities and durations, in this case a proportionate assignment is made in the shift log. This assignment is made using the workplace's shift calendar as the basis.

Example:

In this case we have a shift model set for shift 1: 6.00 am to 2.00 pm and for shift 2: 2.00 pm to 10.00 pm. This shift model is assigned to a workplace that is in accordance with the criteria listed above. Furthermore, we also have an OP log-in at 1.00 pm and an OP logoff at 4.00 pm. For the OP logoff, 90 is uploaded as the yield.

In this case, the shift log for the operation in shift 1 will calculate an order duration of 60 minutes and a yield of 30. For shift 2, an order duration of 120 minutes is calculated and a yield of 60. The RPA-related durations are also calculated based on the shift model that the workplace is based on.

Display of the personnel time in the personnel shift log

In the personnel shift log, the identifier "Post production to main utilization during break" from the HYDRA basic settings is NOT taken into account. This means that the personnel times posted to main utilization (RPA 11) are removed from the postings the calculation is based on (record type "B").

For example: the calculation is based on a shift model from 6.00 am - 2.00 pm with a break between 12.00 noon and 1.00 pm. The status Production is in effect from 6.00 am to 12.30 pm and from 1.00 pm to 2.00 pm.

7.30 hours will be posted as main utilization time for a person logged on from 6.00 am - 2.00 pm (assumption: no multiple machine operation) - if the identifier "Post production to main utilization during break" is set. When the personnel shift log is called up, this time is compared to the shift calendar so that a main utilization time of 7.00 hours is calculated for the shift model provided above.

Graphic personnel shift log

After the logs have been preselected, they can be displayed graphically by person in the detailed reports. After an entry has been selected in the table, the menu item "Graphic personnel shift log" will appear to the left of the menu item.

In the graphic presentation, all of the operations produced during a shift that were assigned to a person in the evaluation period of the selected data record will be displayed by person.

The top bar chart shows the quantities per person. Shown on the Y axis is the person (personnel number) for the highlighted operations, and the produced quantities are shown on the X axis. The bottom bar chart shows the person (personnel number) for the highlighted operations on the Y axis and the absolute values (durations) on the X axis. The bars in the charts are shown "stacked".

In both charts, a legend provides information about the colors chosen for the bars.
