

1 SMS Dispatch

Mapping

SMS are sent by an SMS gateway (software by third-party) to which escalations are forwarded by SMTP. The SMS gateway is provided with the mobile phone number of the determined recipient in the subject line and with the message to be sent included in the message text.

The original subject line of the escalation is overwritten. The SMS gateway might be required to shorten the message text to be transferred due to possible technical restrictions of the SMS communication service.

The mail address defined in the basic settings is used as the return address (just as it is the case for e-mails).

- If required, the SMS gateway shortens the text to a maximum length. Consequently, important information might get lost. For this reason, customers should adjust escalation texts, if necessary, so as for the relevant information of an escalation to be written at the beginning of the message text.

It is recommendable to enter the most important information of the message at the beginning to prevent important text from being cut off or to keep the sense and information content.
