

1 Campaign production

Purpose

You use this function to combine several operations to one campaign and process these over a specified period on one workplace/one machine without interruption.

Integration

You can use the campaign production in the [Graphic planning](#) and request the function as follows:

- Button *Generate campaign* in the toolbar.
- Context menu of the operation.
 - o In the Gantt chart.
 - o In the pool of workplaces.

Requirements

You can use the function *Generate campaign* if you performed the required configuration for the comparison criteria and, if required, for the processing code. The configuration is described in [this document](#).

You can combine the operations under the following conditions:

- Operations must not be logged on.
- Operations must not be fixed.
- The time lag between two operations must not exceed the configured value in the HLS (shop floor scheduling) settings.
- If you use production variants, then you have to plan the operations before you combine them to a campaign.

You can cancel (or cancel in parts) campaigns under the following conditions:

- You can terminate the campaign under the following condition:
 - o No operation of the campaign is logged on.
 - o No operation of the campaign has been completed.
- You can terminate the campaign in parts under the following conditions:
 - o At least one operation of the campaign was started or completed.

- At least one operation of the campaign has not been completed and is not logged on.

Generate campaign

Function authorization	op.cpnbuild
------------------------	-------------

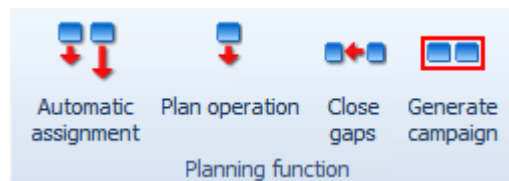

Make sure that all conditions are met regarding the combination of operations for one campaign.

You need to specify the max. time lag between two neighboring operations of a campaign. The system has stored a standard value of 60 minutes.

Campaign production	
Maximum duration between adjacent operations	60 Minutes

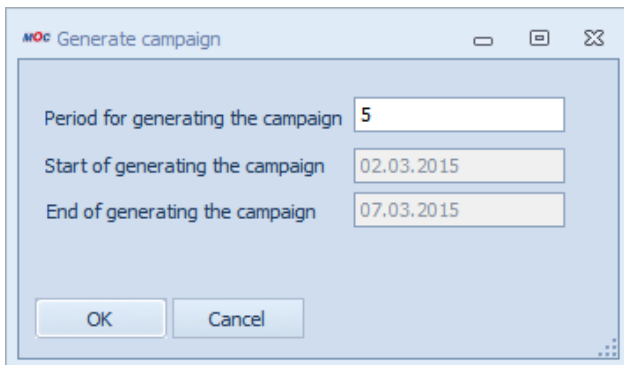

Afterwards you can build campaigns in different ways. The different options are described below:

Option 1: Button in the toolbar

Click *Generate campaign*.

A dialog box appears as follows:

The dialog box titled "MOC Generate campaign" contains the following fields and buttons:

- Period for generating the campaign: 5
- Start of generating the campaign: 02.03.2015
- End of generating the campaign: 07.03.2015
- Buttons: OK, Cancel

Enter a value in the "Days" unit in the field "Period for generating the campaign". Decimal numbers are reliable. The field "End of generating the campaign" updates accordingly when you exit it. Confirm the entry with "OK". The basis to build a campaign is the scheduling of operations that had previously been performed. In accordance with scheduling, the system processes the operations in sequence and checks to determine whether the operations can be combined.

This check integrates an operation if its planned start lies in the period of time when you want to generate the campaign.

A dialog is opened informing on how many operations can be combined and how many campaigns can be built.

For the operations assigned to the campaign, the field "mother OP" is then filled with the leading (first) OP of the campaign.

Option 2: Context menu of the operation (Gantt chart, pool of workplaces)

Select the operations that you want to use to build a campaign. Open the context menu of one of the selected operations. You can then manually generate a campaign for the selected operations.

If a campaign exists for some of the selected operations, then the new operation(s) are added to the existing campaign.

If no campaign exists for the selected operations, a new one is generated. For the operations assigned to the campaign, the field "mother OP" is then filled with the leading (first) OP of the campaign.

If the system identifies during the campaign generation that there is no neighboring operation with the same criteria, this single operation will not become a "single campaign", but it will remain as a separate operation.

Cancel campaign

Function authorization	op.cpndissolve
------------------------	----------------

Ensure that all requirements are fulfilled (see above section "Requirements") in order to cancel operations for a campaign.

You can cancel the campaign in the Gantt chart or in the pool of workplaces using the context menu.

If the requirements are not violated, a confirmation dialog for a (part) cancellation of the campaign appears.

For a part cancellation, the completed operations remain in the campaign. Prepared operations are removed from the campaign and set to the status "not released".

You have two options for interrupted operations:

- Only the interrupted operations are finished. No further quantities are produced for the interrupted operations. The interrupted operations remain in the campaign.

- The interrupted operations are split (requirement: license [HLS-AGS](#) (only applies if HYDRA is used)). The new (previously unprocessed) split operation has not yet been assigned to a campaign and can be used again to generate a campaign. The rest of the operations are finished and remain in the campaign.

After the campaign (or part of the campaign) finishes, the layout of operations that are no longer part of the campaign is updated according to the system settings.

Plan a campaign

You can plan and replan operations that had been combined to a campaign. To perform planning actions, you can use the functions you are authorized for.

If you manual plan activities, you must replan the first operation. If you replan any other operation, an error window pops up with the operation name.

Display of generated campaigns

You can configure the display of operations combined to campaigns in the system settings.

Select via checkbox if the operations combined to campaigns are highlighted in a specific color.

When you activate the checkbox, a narrow bar is displayed in the Gantt chart in the configured color below each operation (OPs) that is affected by the campaign generation. A narrow bar extends over the entire length of the relevant operation (dynamic set-up time, set-up time, processing time, downtime). This narrow bar is also displayed for logged on operations if they are combined.

Posting campaigns

All operations that are combined into one campaign can be processed serially. If required, you can [configure](#) an automatic log on and off in the processing code.

If you have combined several operations to a campaign, you may only log on the first planned operation of the campaign.
