

1 Consumption correlation

Overview

Menu	Resource management → Resource analysis → Consumption correlation
Transaction code	concor
Function authorization	concor

This document describes the "consumption correlation" application in the Manufacturing Operation Center (MOC).

Application

The consumption correlation graphically shows energy consumption in relation to the recorded operations. You can present energy consumption in connection with the accrued information on operations.

Energy documents are assigned to the produced operations by time and selection.

Selection criteria

Reference

Selection of resources using the resource list

Date from / until

Selection of a period for consumption correlation

Workplace

Selection of workplace using the workplaces dialog

Group from / to

Selection based on a group. Selection by drop-down list

Finished article

Restriction to a finished article

Order

Restriction to an order

OP

Restriction to a single operation

Automatic counter assignment (EMG 8.2)

Requirement: In the application "Assignment of counter to machine", the energy meters are assigned to workplaces. If this option is checked, you cannot select the energy meters manually. Following the assignment of counter to machine, the energy meters are identified and then displayed as result.

Detail application consumption correlation

The detail application includes two sections. The upper part shows the log records of operations, the lower section displays the consumption.

The log records of operations matching the selection criteria entered above (period from/to, article, order number/operation number) are displayed as individual bars in the detail application (1 row for each workplace/machine).

The user can select the displayed log records (multiple selection possible by using the Ctrl key). The resulting time slice/s is/are used for presenting the consumption.

The lower section of the detail application shows two sections with different information for each selected consumption meter.

Section 1:

This section shows the result of the correlation: The periods result from the selected order and multiple selection of order bars.

Section 2:

The consumption documents matching the selected consumption meter and period entered in the selection panel are shown. However, they are not displayed as complete document but rather as averaged point (average power in the document). This refers to the load profile of the consumption resource.
