

1 Registered Events

Overview

Usage

Escalations can be chosen from a list. The list is provided by the system. It is not possible to add new entries.

Selection criteria

The application provides the following selection criteria:

Event

The event triggers an escalation. Applications generate the event if specific situations occur.

Using the search function, an event may be chosen from the list of available events. It is not possible to enter events that do not exist.

Class

By defining the class, escalations can be assigned to a product and/or product group.

Category

Escalations can be classified as "technical" and "application-related" via the category.

Field descriptions

Event

The event triggers an escalation. Applications generate the event if specific situations occur.

Description

Description of an escalation

Class

By defining the class, escalations can be assigned to a product and/or product group.

Category

Escalations can be classified as "technical" and "application-related" via the category.

License key

License key required in order for the application to provide the escalation.

Please note that the license key indicated here does not necessarily correspond to the MW 3.0 license key. If this is not the case, it can be specified as follows:

MOC menu → Help → System information → Authorization

The left column includes current licenses and/or authorization keys. The right column includes the keys transferred from MW 2.x.

Cyclic monitoring

It is indicated here if the selected event is monitored cyclically.

If this is true, the system suggests a monitoring cycle.
