Selection criteria

The following selection criteria are available in the application:

Show authorized entries only

Premium groups have a responsibility area. If this option is activated, only those premium groups are displayed for which the user has a responsibility area authorization to do maintenance. If the option is inactive, all other premium groups present can also be displayed, but not maintained.

Field description

Premium group

Identification of the premium group.

Valid from

Date from which this version of the premium group is valid. A premium group can exist in various versions. To make a reasonable monthly view of the calculation possible, the premium groups should only change at the beginning of the month.

Valid to

The system automatically controls the "Valid to" date. A premium group is automatically valid until the next version starts.

Premium group type

The following types are possible:

- **Incentive bonus:** The group's performance is determined from the standard times for the time per piece produced and the actual staff processing time required.
- **Utilization bonus:** The group's performance is determined from the standard times for the time per piece produced and the actual machine processing time required.
- **Premium area:** If the additional function "Premium areas" is present, this type can be used to create premium areas to which premium groups can be assigned in another dialog.
- **Alternative types:** If the additional function "Formula-based premium/ incentive wages" is present, a letter can be specified in the related field "Alternative types" as an alternative type of the premium group. In this way, if necessary, other types of premium groups can be represented using "Formula-based premium/ incentive wages". However, the letters "L", "N", "B" and "I" are reserved internally for HYDRA and cannot be used as an alternative type.
- **Inactive:** The premium group is no longer compensated starting on the day of validity.

The calculation formulas for incentive and utilization bonuses are described [in another document](#).

Premium scheme

Additional free numeric field that can be used with the additional function "Formula-based premium/ incentive wages".

Payment according to premium group

If the additional function LLE-PRB "Premium area" is present, it can be used to specify a superordinate premium area or another premium group for each premium group that is not a premium area, according to which the people in this group are paid. If the additional function LLE-PRB "Premium area" is not present, this field is not visible.

Responsibility area

A responsibility area must be assigned for each premium group. This field is mandatory because otherwise no authorization checks can be performed on the data of the premium groups.

Premium accounts

When "Formula-based premium/ incentive wages" is used, specifications for the premium groups specific to a customer are stored in the premium accounts. In the standard premium forms no premium accounts are processed.

Weekdays

When "Formula-based premium/ incentive wages" is used, three numerical and one alphanumerical default values can be stored per weekday. In the standard premium forms no weekday related specifications are processed.

Processing functions

The following window opens for editing a data set:

The screenshot shows a software window titled 'Insert' with a standard Windows-style title bar. Inside the window, there is a 'Main page' header and three tabs: 'Premium group' (selected), 'Premium accounts', and 'Weekdays'. The 'Premium group' tab contains a form with the following fields:

Premium group	
Premium group	
Valid from	1/1/1900
Valid until
