

1 Requirements Overview

Summary

Menu	Material management → Inventory management → Requirements overview
Transaction code	reqov
Function authorization	reqov

Usage

The function “material requirements” provides an overview of the materials required at machines. It is particular to this function that material requirements are exactly determined by day taking the shift calendar into account. Consequently, material requirements are distributed according to the run time of OP(s). “By day” means here “by shift”, i.e. the day starts with the beginning of shift 1 and ends with the end of the last shift (e.g. shift 3).

Requirements

The PPS system transfers the materials required for the production of an operation and, as a result, they are available in the component list of the OP within the system.

Please note:

The determination of material requirements depend, among others, on the planned start date of an operation. For this reason, the planned start date of an operation needs to be transferred correctly by the PPS system or planned in shop floor scheduling. If, however, the order sequencing function is used this planned date is used to define the order of processing (internal algorithm). In this case, the planned start date can no longer be derived.

Selection criteria

The application provides the following selection criteria:

Material type

This selection criterion refers to the material type of the material. All materials assigned to the selected material type are shown.

Material

Shows all materials assigned to the selected material.

Workplace

Shows all materials assigned to the selected workplace.

Order

Shows all materials assigned to the selected order.

Control

Shows all materials assigned to the selected control.

Planned start

Shows all materials assigned to the selected planned start.

MES order number

Shows all materials assigned to the selected MES order number.

Consider pool of groups

Defines whether or not the pool of groups is to be taken into account for selection.

The result of overlapping selection criteria is displayed if several selection criteria are in use.
