

1 Signature Types

Summary

Menu	System administration → System settings → Signature types
Transaction code	sigtyp
Function authorization	sigtyp.*

Usage

The signature type is used in the signature collection to define the mandatory authentication type for postings.

Integration

Use Signature type to define in the [signature matrix](#) definition which postings must be authenticated by which signature type.

These settings will be taken into account for both, maintenance dialogs of the MES Operation Center (MOC) and entry dialogs of the terminal.

Field descriptions

Signature type

Key of a signature type.

Designation

The designation stands for a detailed signature description

Mode

The mode identifies the inspection type that is to be performed. The following entries are provided:

Password checking → a confirmation by way of the correct combination of card/badge number (shop floor terminal) and/or user name (MOC) and password is mandatory.

No password checking → No password to be entered

Signature collection without signature dialog → No confirmation through a second person and no password necessary. Only the authorization level from the HR master data will be checked in this mode. The corresponding authorization level of the person will be checked against the person's or badge number entered into the login dialog. No separate signature dialog will be displayed.

In the "Signature collection without signature dialog" mode the signature 2 check must not be performed.

A signature type can only be deleted if this signature type has not already been used to sign. The server will check to this end, whether this signature is used in the posting events and will refuse a deletion, if necessary.
