

1 Status Report

Summary

Menu	Production Facility Management → Status analyses → Status report
Transaction code	mstrp
Function authorization	mstrp

The status report is an indispensable tool for any production executive. Whether planner, foreman or team leader, this report can be individually configured to show downtimes in any form.

Usage

This evaluation provides status information relating to a workplace/ machine for a specific period of time and a certain number of workplaces. All of the accrued downtimes are pulled together in this evaluation and can be prepared in the form of a graphic or in table form based on what the user intends to achieve.

Selection criteria

The application provides the following selection criteria:

Workplace

Search by machine/ by workplace. You can run a search using wildcards.

Group

Search by workplaces/ machines that are assigned to the group that was entered. The selection is made using the field Group in the workplace/ machine configuration. You can run a search using wildcards.

Cost center

Search by workplaces/ machines that are assigned to the cost center that was entered. You can run a search using wildcards.

Company

Search by workplaces/ machines that are assigned to the company that was entered. You can run a search using wildcards.

Responsibility area

This selection criterion references the responsibility area in the machine master data. Keep in mind that only machines are displayed that the user has also assigned responsibility areas to.

Report group

This selection criterion references the report groups. All machines or workplaces are displayed that are assigned to the selected report group.

Short designation

This selection criterion references the short name of the machines in the master data. All of the machines or workplaces are displayed that match the string that was entered. You can also run a search using wildcards.

Designation

This selection criterion references the name of the machines and workplaces in the machine's master data. At the bottom, only those machines are displayed that are identical to the string that was entered. You can also run a search using wildcards (placeholders *) in this field.

Status

Limits the selection to a certain status. Displayed in the combo box are the status texts that the selection is filtered through.

Include status for RPA 11

Accounts for the status for RPA 11 (usually, this is the "Production" status).

Date

The period of time from which data should be selected.

When selecting via shift(s), the shift date is evaluated, whereas when selecting by time, the selection is based on the start date. Please keep in mind that a selection by shift is only supported for ADE and MDE data, not for WRM data.

Shift/ time

Selection by shift (only ADE and MDE events) or by time period. If no shift has been selected, all shifts are considered.

The two times each refer to the start or to the end of the date periods listed above.

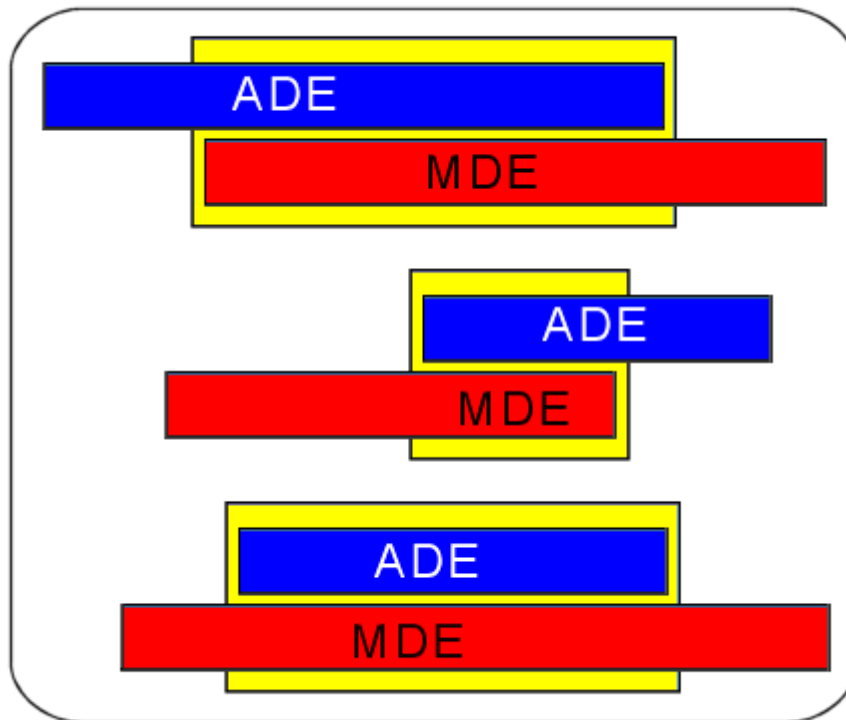

Order/ article

When you choose the option "Order", you must enter an order or an article.

For this kind of evaluation type, only the finished ADE postings are considered. If the order is currently still running on the machine, the time period between the last logon and "now" is not taken into account. As such, it is by all means possible that there are differences between the machine evaluation and the order-related evaluation. Only ADE postings are taken into account that have started during the evaluation period. If necessary, the selection period must be selected so that the ADE postings that are to be taken into account are within this selection period. For this order-related evaluation, MPDV recommends the shift-related selection option.

The following illustration shows an example of an overlapping of ADE and MDE postings. The ADE postings take priority in this evaluation type. The yellow areas illustrate the results of this evaluation. MDE quantities and durations are calculated on a pro rata basis to achieve the result.

If orders are logged on in parallel at the machine, for this evaluation type, the full machine time (yellow area) and quantity is assigned to each order. The fact that orders are run in parallel will not result in a proportionate calculation.

Resource type/ resource

When choosing the option "Resource", a resource must be entered.

For this kind of evaluation type, here again only the finished postings are considered. For this evaluation type, only the resource postings take priority. The principle is the same as when running an evaluation by order.

Additional selection notes

Long term data

If the selection period exceeds the period for the online data area, the system applies the implicit solution and selects the medium-term data area as well.

Determining a shift-adjusted quantity

This option known from MDE 7.2 is set by default in MOC. What this means is that postings that were generated as a result of a shift change are not considered when determining the quantity. All that is accounted for here is the exact moment when a machine status was set. If this moment is outside of the evaluation interval, in this case the output will be 0.

The status assigned to RPA 12

Status assigned to RPA 12 (typically the status for breaks and for shift-free times) are not selected.

Status report detail application

Tabular evaluation of the downtimes for a specific period of time and a certain number of workplaces. The result depends on the selection and therefore on the selection criteria made available on the selection panel.

The following data are available:

Status category**Status**

Status number as per configuration

Designation

Designation of the status

RPA

Resource performance account number

Status class

Abbreviation of the status class

Duration category**Duration**

Total time of all statuses determined within the evaluation period (i.e. not all downtimes within this evaluation period are compressed in this field).

%

Proportion of total status duration as compared to the total duration of disturbances shown as a percentage.

Quantity category**Quantity**

Total number of statuses determined that were applicable during the evaluation period.

%

Proportion of the number of statuses to the total number shown as a percentage.

Comparison production - downtimes detail application

In this detail application, the production time (green) accrued during the evaluation period and the sum total of all determined status times, not including RPA 11 and 12 (red) are compared in the form of a bar chart.

The presentation always relates to all of the displayed statuses (there is no highlighting option in this table).

Status hit list (durations) detail application

The downtime durations for each status marked in the table are shown in the form of a graphic in the status hit list (durations) detail application.

In the combo box "Displayed series" you can define whether the durations displayed as a percentage should relate to the total number of downtimes (RPA 1-10) or to the total duration (RPA 1-11). If both options have been selected, both bars are displayed (for each status).

Status hit list (quantity) detail application

The total number of status changes for each status marked in the table is shown in the form of a graphic in the status hit list (quantities) detail application.

As opposed to the previous detail applications, no further display options are available here.
