

1 User Field Key

Overview

HYDRA menu	System administration → System settings → User field key
FEDRA menu	System administration → System settings → User field key
Transaction code	ufk
Function authorization	ufk

Purpose

User fields offer the possibility to store and, if necessary, display further project-specific information in the system besides the fields that are available by default. Therefore, 1-n user fields are assigned to the user field key to show them with the relevant value at specific objects (e.g. operation).

This function can be used to create/change unique user field keys in the system.

Integration

User field keys always exist in relation to the different objects in the system. For further information, refer to the documentation [MBL_Userfields.pdf](#).

Editing functions

The relevant functions "create" or "edit" are used to create a new user field or to change it.

Field descriptions

Create/change user field key

These fields are affected when creating or editing a user field key:

Object

Object to which the user field key is assigned

User field key

Unique ID of the user field key

Responsibility area

Responsibility area for which the user field key is used

Designation

Descriptive designation of the ID or user field key.

For further information on the configuration of user field keys and user fields, refer to the documentation [Configuration_Userfields.pdf](#).
