

1 Workflow Management - Workflow Functions

Overview

Menu	Master data – Workflow management – Workflow functions
Transaction code	wffunc
Function authorization	wffunc

Usage

In the Workflow functions application, functions can be defined and administered. The actual filing/creation of the functions, however, is performed in the MES workflow management server.

Functions are created in the MES workflow management server from the combination of groups and roles. These functions can be assigned tasks.

Selection criteria

The following selection criteria are available to the user:

User

User

Role name

Role name. Please note: wildcard entry is not possible.

Group name

Group name. Please note: wildcard entry is not possible.

Workflow Functions Detail Application (Table)

The Workflow function detail application includes a tabular overview of the functions created and the related attributes.

The data available in the table are described below. These data might not be shown by default. In this case, they can be added using the column selection.
