

1 Merged Batch

Definition

A merged batch is a special kind of [HYDRA batch](#). One can distinguish a merged batch from a non-merged batch, as the merged batch is assigned 1 - n batches. The merged batch "embraces" the assigned individual batches.

Merged batches are [especially identified in the system](#) and with respect to data, they have a special relationship to the included individual batches.

Fields of application

Merged batches are used to improve logistical and systemic manageability of the collection of batches in the production process. Merged batches have been designed to embrace individual batches. Consequently, by using merged batches and/or merged batch numbers, processes can be performed in relation to the included individual batches, without having to perform them separately for each individual batch.

Typical fields of application for merged batches are, among others:

- Collection of serial numbers
In this case, merged batches are used to be able to identify all of the included serial numbers.
- Packing/palletizing and stock transfer processes
Several batches are combined logically. This combination may then be relocated or used elsewhere, once it has been identified.
