

1 SAP - PP-PDC

Definition

PP-PDC (Production Planning – Plant Data Collection) serves as interface to the SAP ECC production control. It replaces the previous interface that was supplied under the name of communication channel 2 (CC2) and extends its functions.

The interface is implemented to connect MES subsystems, which are also used to enter operation confirmations. To perform a data collection plausibility check in the sub-system, PP-PDC offers download capabilities for transactions (initial, delta and deletion download) and of workplaces, variance reasons and quantity units.

This is implemented on the basis of the [BAPI](#) technology, whereas the SAP transceiver that had been applied before is no longer being used. This approach constitutes the future communication standard within an integrated SAP system architecture. The BAPI technology is now used to *connect HYDRA on business level*.
