

1 Configuration of File Connections

File Server (MES inbound processing)

Parameter	Value
INTERFACE_PATH	This directory includes the files to be transferred to HYDRA. From there they are copied to the working directory (WORK_PATH).
WORK_PATH	The files are transferred from the working directory to HYDRA. The file transferred at last is stored in this directory with the extension ".SAV".

File Client (MES outbound processing)

Parameter	Value
INTERFACE_PATH	This directory includes the files to be transferred to the partner system. The partner system can collect the files there.
INTERFACE_EXT	The interface extension refers to the extension of the finished file. If the interface directory includes a file with this extension it may be collected from the partner system. The file name is determined by the corresponding message type.
WORK_PATH	When data are provided, they are first entered in the working directory (WORK_PATH). Once completed, they are transferred from the working directory to the interface directory (INTERFACE_PATH). If this directory already includes a file it will not be transferred from the working directory to the interface directory. The file stored in the working directory is extended/new rows are added until the interface directory is free again.
