1 Personnel Scheduling - Overview

Purpose

Graphical application to plan absence, shift sequence and on-call duty for single employees or employee groups.

Implementation Considerations

Use this function package to:

- present and plan absences and shifts in a graphical interface;
- create an overview of the available manpower per shift or control the attendance rate;
- display the employees' future account balances
- plan employees with on-call duty and compensate them within personnel time management.

Integration

This personnel scheduling function package requires *Time and Labor Data Evaluation* to define working time and payment models.

Personnel scheduling is not merely used for labor time calculation, but often also to plan available employees e.g. during work scheduling.

Features

- Personnel scheduling
 - Presentation of planned and compensated absence, working time models, shift sequences, target times etc. using a separate annual calendar per employee
 - Display of planned working time and absence for multiple employees over any period complete with per shift totals of employees who are available, not available or on leave
 - Graphical interface to plan absence and to re-plan working time, shifts and payment rules
 - Optionally show current account balances plus account balances at end of period or end of year
 - Optionally hide absence reasons for planned absence (e.g. to print planning results)
 - Calculate daily attendance rate as a percentage
- Labor time schedule
 - Tabular display of planned working time and absence (e.g. to display planned employees for single or multiple shifts)
 - Totals for available employees, for example by shift and/or by activity

- Account planning
 - Simulation of future account balances (e.g. at year's end) on the basis of planned working time and absence
- On-call duty
 - Cyclical or individual on-call duty planning
 - Display of on-call duty in personnel plans with totals
 - Payment rules for on-call duty and stand-by duty
 - Evaluation of stand-by duty in labor time statistics
 - Presentation of stand-by duty in time sheets

Available user fields		
Where	Object type/user field key	Source (type)
Table	PNR/SYSTEM	HR master data (HR)
How to configure user fields? Which user field types are available?		

Personnel scheduling can be used to gain an overview of employee shift sequences and working times. The annual overview shows an employee's shift and absence planning for the entire year.

The screenshot displays the 'Personnel scheduling' application window. The 'Main page' tab is active, showing a toolbar with icons for 'Request data', 'Cancel', 'Print preview', 'Print all', 'Labor time maintenance', 'Absence planning', 'Year overview', 'Save', 'Settings', and 'Help'. Below the toolbar, the 'Year' is set to 2011 and the 'Person' is 40789. The 'Show absence reason' checkbox is checked. The 'Year overview' section shows a calendar grid for 2011, with columns for days 1 through 31. The grid is color-coded: green for 'Lea' (Leave), orange for 'PubH' (Public Holiday), blue for 'FLX' (Flexible), red for 'III' (Illness), and yellow for 'Sch' (School). The grid shows various shifts and absences throughout the year.

As an alternative to the annual overview, you can view the information for a group of employees in the *Overview of periods*.

Purpose

Below the selection criteria, the year overview shows the current account balance and the account balance for the end of the year for the leave account (account with the number 4 when configuring accounts).

The application shows absences with the comment from the [Control of absences](#) or from the absence planning for the respective day. For days with multiple planned absences, the application shows the absence reason with the greatest priority in the upper part and the absence that is of lower priority is shown below. Absences that have been requested via the absence workflow but not yet approved are displayed in italics.

For the staff displayed, you can show additional columns in the grid. This includes the person's current account balances, the account balances at the start and end of the selected period and at the end of the year.

By right-clicking, you can plan an absence, a personal shift type or a personal working time for the selected period. In the [Control of absences](#) application, you can define the absences displayed in the context menu and their colors. The submenu *Personal day type* shows the shift types of the working time day types.

In addition, you can plan [Personal models](#) and comments using the context menu. If a comment is defined for a day and you go with the mouse over this day, the comment will be shown as tooltip in the calendar. A small, red triangle in the top right edge of the relevant day shows if a tooltip is available.

In the *Overview of periods*, you can plan absences and personal shift types for several employees simultaneously. To do so, select the relevant period for these employees. You can only plan an absence and/or personal shift type for several employees simultaneously if you use the absence entry and/or the shift type in the context menu.

The table in the lower area of the window shows a list of the persons planned to be present and absent per shift type. Use this list to check if enough employees are present for the shift. A distinction is made between employees that are available, not available or off work (free).

In the *Overview of periods*, you can delete absences. To delete absences, two options are available. If you select *Delete complete absence*, the complete absence is deleted as it has been planned before. If you only want to delete a single day of a planned absence, select *Delete selected period*.

Integration

Employees can view their shift plan via the PZE terminal. The configuration is described in the documentation dealing with the [terminal shift plan](#) (only applicable if HYDRA is used).

Selection criteria

The application provides the following selection criteria:

Data to be displayed

Three information items can be displayed per day. Use the three selection fields to specify which data should be displayed for a day.

Shift plan

Displays any possibly planned absence and the planned shift type on work days. For the days evaluated, the application outputs actual data and for days that are not evaluated, the application outputs the planning.

Absence

Displays any possibly planned absence.

Absence 2

Displays any possibly planned second absence for the day.

Attendance time

Displays the completed working time.

Target time

Displays the planned target time.

Normal time

Displays the planned normal time.

Planned start time

Displays the planned start time.

Planned end time

Displays the planned end time.

Working time day type

Displays the planned working time day type.

Shift type

Shows the shift type used for the previous days and the planned shift type for the current and future days. To identify the planned shift type, the system uses both the personal day types and the personal working time. The application only shows the shift type for planned working days.

Planned shift type

Displays the planned shift type from a personal shift rhythm model or a model stored in the HR master data. The application only shows the planned shift type for planned working days.

Different shift type

This field always contains the actually used shift type if this shift type differs from the planned shift type of the shift rhythm model defined in the HR master and/or a personal model.

Payment day type

Displays the planned payment day type.

Working time model

Shows the planned working time model.

Shift rhythm model

Displays the planned shift rhythm model.

Payment model

Shows the planned payment model.

Overtime type

Displays the planned overtime type.

Personal working time

Displays any possibly planned personal working time. The personal working time is represented by an X.

Personal working time day type

Displays any possibly planned personal working time day type.

Personal shift type

Displays any possibly planned personal shift type.

Personal payment day type

Displays any possibly planned personal payment day type.

Personal working time model

Displays any possibly planned personal working time year model.

Personal shift rhythm

Displays any possibly planned personal shift rhythm model.

Personal payment model

Displays any possibly planned personal payment year model.

Personal overtime type

Displays any possibly planned personal overtime type.

On-call duty 1

Start time of the first interval of [on-call duty](#).

On-call duty 2

Start time of the second on-call duty interval.

Show absence reason

If this option is disabled, the application shows all planned absences in *“red”* and with the text *“N/A”* for *“Not present (Nicht Anwesend)”*.

If the application does not show an abbreviation for the corresponding days in the graphic absence planning after you have planned an absence, it might be that there is no target time defined for these days. You can check the planned working time for the corresponding days in the [Working time information](#).

If you plan absences for a period in the past, in some cases the absence can only be displayed after the [labor time calculation](#) has been carried out.

If you only change the period for a planned absence, the system only resets the respective period and recalculates it with the next labor time calculation.

Field descriptions in the *Overview of periods* tab

Attendance rate

The attendance rate is calculated from the sum of the target time and/or normal time of the employees planned to be present divided by the sum of the target time and/or normal time of all employees. When half days are off, the system only allows for the duration of the planned attendance time.

The result is displayed as a percentage and rounded (without decimal places) before totaling the first shift.

Available

Staff who is planned to be *present*, i.e. the target and/or normal time for the day is greater than 0 hours.

Not available

Staff who is planned to be *absent*, i.e. an absence is planned for that day.

Free (off work)

Staff for whom no target and/or normal time has been planned, i.e. the employee is not required to be present on this day.

On-call duty

The number of staff with on-call duty is displayed in the lower section of the overview of periods per shift and as a grand total.

The specification as to whether the target time or normal time is used for the above-described fields depends on the [setting](#) *Identification of available staff on the basis of target time/ normal time*.

Field description

Identification of available staff on the basis of target time/ normal time

If you have to plan additional shifts on the weekend or on days off, it may be required that the available staff be identified based on the normal time because on such days there is usually no planned target time. For flextime and flexible shift day types, the normal start and end time specify the duration of the normal time. Note that this setting also specifies how the planned absences are displayed. For example, leave is also displayed on weekends although it is not set off in the day evaluation due to the missing target time. The display is updated only after you have refreshed the data.

Selection for planning

Use this option in the planning of a shift type to specify if only those shift types contained in the current planning are to be displayed via the context menu or if a selection can be made from all of the shift types available in the working time day types. The number of shift types to be displayed is limited to 10.

Shift type - case sensitive

In totaling the employees, depending on the setting, the shift types are not case sensitive. For example, the number of shifts identified by "F" and "f" is displayed as a common total.

Attendance rate

Use this option to specify for the logged in user if the attendance rate should be displayed. The setting *Identification of available staff on the basis of target time/ normal time* specifies if the normal time or the target time will be set off.

The settings for the display in personnel scheduling are stored per user.

Labor time schedule
PivotGrid

Integration

Employees can view their shift plan via the PZE terminal. The configuration is described in the documentation dealing with the [terminal shift plan](#) (only applicable if HYDRA is used).

Selection criteria

The application provides the following selection criteria:

Shift type

Enter "*" in the selection field *Shift type* to view all employees. If you leave this field empty, the application only shows employees where neither a shift model nor a flexible shift model is planned.

On-call duty only

If you select the option "On-call duty only", the application only shows employees with on-call duty.

Show absence reason

If you disable this option, the application shows all planned absences in "red" and the text "N/A" for "Not present".

Field descriptions

Shift plan

Displays the planned absence and/or the planned shift type on work days.

Availability category

If you group the *Labor time schedule* by a column, the columns *Available*, *Not available*, *Day off* show how many employees are available or not.

Absence category

Select the *Absence* category to show the columns for absence times.

Absence 2 category

Select the *Absence 2* category to show the columns for the second absence that is planned.

On-call duty category

Select the *On-call duty* category to show the columns for on-call duty times in the labor time schedule. If you group the *Labor time schedule* by a column, the column *On-call duty* shows the number of employees with planned [on-call duty](#).

Working time category

Select the *Working time* category to show information on the target time, standard time, breaks, beginning and end of working time.

Day types category

Select the *Day types* category to show the columns for the planned working time type, payment day type and the overtime type.

Personal day types category

Select the *Personal day types* category to show information on the planned personal day types for working time, shift type and payment.

Personal models category

Select the *Personal models* category to show information on the planned personal models for working time, the shift rhythm, payment and overtime.

Additional info category

Select the *Additional information* category to show additional information from the HR master.

The labor time schedule also integrates the settings for the *shift type* and the *identification of available staff* from personnel scheduling.

The columns that include personal data from the HR master (e.g. department, activity) always show the data valid for each person on the first day of the selected period.

4 Account Planning

Overview

Menu	Human resources management→ Evaluations→ Account planning
Transaction code	papl
Function authorization	papl

The Account Planning function allows to compute an account balance for a day in the future in consideration of planned absence. This function may, for instance, be used to prepare a remaining leave chart including the leave days not yet scheduled at the end of the year.

Selection criteria

The application provides the following selection criteria:

Date

Date for which account planning is to take place. This date may be in the future.

Account

Selection of the account for which the planning is to be made.

Compression

This button may be used to set whether only the account balances at the date entered or in addition all days for which an account change has been registered are to be displayed at the date entered.

The account balance for the current date as displayed in the chart may deviate from that indicated in the schedule of [Current account balances](#), if not all labor time has been calculated for past days. Account planning considers such days by setting off planned account changes.

5 On-Call Duty

Summary

The additional module “on-call duty” allows for on-call duties to be planned in the working time model and remuneration rules for on-call duty and stand-by duties to be defined in the remuneration model.

The personnel scheduling function and the labor time plan show the on-call duty times as well as the number of employees who are planned to be on duty.

Standby times can be evaluated using the labor time statistics and wage type statistics function. It is also possible show the standby time when editing labor time and within the time sheet.

Configuration of On-Call Duty Times

Up to two standby intervals may be defined within the “on-call duty” tab of the [working time day type](#).

The screenshot shows a software window titled 'Edit' with a standard Windows-style title bar. Inside the window, there is a 'Main page' tab and a set of sub-tabs: 'Working time', 'Breaks', 'On-call duty' (which is currently selected), 'Payment', 'Options', and 'Last editing'. The 'On-call duty' tab contains two sections, 'On-call duty 1' and 'On-call duty 2'. Each section has two input fields: 'Beginning' and 'End'. The 'On-call duty 1' section has its 'Beginning' field set to '00:00' and its 'End' field set to '01:00'. The 'On-call duty 2' section has its 'Beginning' field set to '01:00' and its 'End' field set to '02:00'. The rest of the window is empty.

Planning of On-Call Duty

There are different possibilities to plan on-call duties, as the on-call duty is defined within the working time day type:

- Cyclically recurring on-call duties can be configured in the [working time model](#).

- [Personal models](#) and [personal day types](#) allow for the on-call duty to be defined individually.
- The [personal working time](#) allows for on-call duties to be planned for single days without having to create an additional working time day type.

Field Descriptions

Totaling: On-call duty

The number of people who are on duty is displayed in the lower section of the period overview per shift and as total number.

Presentation of On-Call Duty in Labor Time Schedule

Within the [labor time schedule](#) standby times can be activated using the “on-call duty” category. If the personnel schedule is grouped by a column, the “on-call duty” column shows the number of employees who are on duty:

The screenshot shows the 'Labor time schedule' application window. The 'Selection' section includes filters for Person, Company, Date (1/2/2013 to 1/15/2013), Shift type (*), and checkboxes for Available, Not available, Off, On-call duty only, and Show absence reason. The main table displays employee availability data.

						129	11	56

Selection Criteria

On-call duty only

If the selection parameter “on-call duty only” is checked only employees are displayed who are on duty.

Settlement of On-Call Duty and Stand-By Duty

Payment rules for on-call duty and stand-by duty may be defined in the [payment day type](#).

Wage type	Designation	Processing	Compensation
100	Basic wage	Until reaching target time	
200	Extra work	Overtime from 0:00	
220	Extr Adder 25%	Overtime from 1:00	
300	Night Extra 25%	Fixed time from 20:00 until 6:00	
500	On-call duty	On-call duty - maximum duration 2:00	

On-call duty and stand-by duty are only offset as such if an on-call duty is defined within the working time day type and the remuneration day type includes the corresponding remuneration rule. This allows for the on-call duty to be planned and controlled using the working time day type and remuneration day type: If the on-call duty is generally defined within the working time day type it may be enabled or disabled by rescheduling the remuneration day type. Provided that the remuneration rule for on-call duties or stand-by times is generally defined in the remuneration day type, stand-by times control within the working time day type whether or not an on-call duty is planned.

Field Description

On-call duty

The remuneration rule “on-call duty” is allocated for the entire duration of the stand-by time. The “maximum duration” field, for example, restricts the posting to one hour per day. The maximum duration affects both on-call duty intervals. If the “hide” option is checked the remuneration rule is only processed if the no stand-by duty exists on that day. Since on-call duty may also be planned on days without clockings or when absence is planned, the remuneration rule “on-call duty of the **planned** remuneration day type is allocated. This also applies if another remuneration day type is entered in a clocking that might exist for this day.

Stand-by duty

This remuneration rule allows for a stand-by duty to be allocated. Working time is processed as stand-by time if it completely lies outside of the working time frame and, at least to some extent within the stand-by duty frame. The “minimum duration” field allows for a minimum duration to be posted when it comes to short stand-by times. If the “hide” button is checked the stand-by time is not included in the working time of the current day and, as a result, it does not affect this day’s overtimes or reduced working hours. The remuneration rule “stand-by duty” must not be used along with the remuneration rules “working time before start of skeleton time” and “working time after end of skeleton time”.

When on-call duty times are allocated, it has to be taken into account that the corresponding working time is not rounded off within evaluation parameters due to the rounding rules “before target start” or “after target end”.

Editing of Stand-By Times

The “labor time maintenance” dialog allows for stand-by times to be edited. The columns for the on-call duty and stand-by times can be displayed in the “clockings” table:

As on-call duty is allocated on the basis of the remuneration day type planned for the corresponding day, the assignment of another remuneration day type within a clocking of the day does not affect on-call duty. Another remuneration day type has to be planned instead using the “personal day types” option.

Evaluation of Stand-By Times

If on-call duty or stand-by times are posted onto a wage type using corresponding remuneration rules they can be evaluated using the [wage type statistics](#) function.

Additional columns that show the duration of on-call duty and stand-by times may be activated in the [labor time statistics](#) dialog:

On-call duties can also be displayed in graphics :

The duration for on-call duty and the duration for stand-by times may be listed each in a separate column within the [time sheet](#). In the data source this data is included in the fields `personaltimesheet.dailydata.oncallduty` (on-call duty) and `personaltimesheet.dailydata.standbyduty` (stand-by duty).

The maximum duration of the remuneration rule for on-call duty and the minimum duration of the remuneration rule for stand-by time are not taken into account in the labor time statistics and with the two described fields of the time sheet. The wage type statistics function displays the availability times taking the maximum or minimum duration into account. These durations can be shown in the time sheet by displaying the corresponding wage types.
