1 Graphic Batch Tracing

Purpose

The Graphic Batch Tracing function package provides a graphical presentation for tracking.

Implementation Considerations

You use the Graphic Batch Tracing function package if you intend to perform tracking in the MES yourself.

Features

- Evaluation of graphic batch tracing
 - Graphical presentation (tree structure) for evidencing the creation of lots and batches
- Forward tracking
 - Optional representation of direct output batches developed from a material and/or intermediate product, or illustration of overall batch history to the finished product.
- Backward tracking
 - Optional representation of direct input batches used for an intermediate and/or finished product, or illustration of overall batch history beginning from the input material.
- Consideration of batch archive

2 Graphic Batch Tracing

Usage

Graphic batch tracing is used to represent the relations between the input batches incorporated in a process and the resulting output batches as tree diagram.

Procedure

When using the [graphic batch tracing](#) application, it is especially important to consider which batch links and relations are of interest to the user.

The direction and depth of information are decisive factors.

Possible directions are:

- Going through the batch chain from the beginning to the end
The "consumption" option must be selected if the user is interested in the successive consumption of batches within their process chain.
- Going through the batch chain from the end of the batch chain to the beginning
The user is interested in the development process starting from the output batch and tracing back to the input batches used in the very first process.

Possible levels of information are:

- Direct predecessor/successor level
Only one level or relationship/cross connection of batches may be considered.
- All predecessor/successor levels
All levels or relations of batches may be considered.

Consequently, the right direction and depth of information is important for the analysis and the selection has to be chosen logically (last but not least because of the data volume that might accrue).

- No view or direction (development/consumption) selected
If the direction is not selected specifically, the default system values will be used. Here all input batches are displayed in relation to the output batches they derived from.
- View or direction selected
 - "Origin" checkbox (direction of output batches --> input batches)
For the entered batch all integrated input batches from the preceding level (preceding process) are shown.

If the "initial/final batches" field is still selected, all affected input batches spanning all levels/processes up to the origin are shown.

- "Consumption" check (direction: input batches --> output batches)

For the entered batch, all output batches resulting for the direct subsequent level are displayed.

If the "determination of initial batches" field is still selected, all affected output batches spanning several levels/processes up to the end or the last level are shown.

The "consumption" option and the "Direct input/output batches" checkbox are set by default in the system.

3 Graphic Batch Tracing

Summary

Menu	Material management → Batch tracing → Graphic batch tracing
Transaction code	battrg
Function authorization	battrg

Usage

The [graphic evaluation](#) is to be used to determine, with regard to the output batches, which input batches have entered and with regard to input batches, which output batches they have entered into.

Depending on the selection, only the direct predecessors (batch origin) or the direct successors (batch consumption) are shown or all predecessors or successors. Here only those batches are considered that were generated in the specified period.

Selection Criteria

The application provides the following selection criteria:

General

Batch number

Displayed data can be restricted to a specific batch number.

Origin

Batch origin/development indicates all batches contributing to the selected batch.

Consumption

Batch consumption indicates all of the produced output batches for the selected batch. This configuration is set by default.

Direct I/O batches

Only directly connected input and/or output batches are shown for the entered batch. This configuration is set by default.

Initial/final batches

All linked input or output batches matching the entered batch are shown up to the origin and/or end of the process.

Date from ... to ...

All produced input and output batches in the selected period are displayed.

Consider long-term data

Data from the long-term archive is selected as well.

Attributes**Attributes 1 - 10**

Selecting an attribute as a selection criterion displays all links/relationships of batches that currently have this identifier.

Batch attributes**Batch attributes**

Selecting a batch attribute as a selection criterion displays all links/relationships of batches for the material type of which this batch attribute has been configured and that are currently assigned this identifier.

Alternative batch numbers**Alternative batch number 1-20**

Selecting an alternative batch number as a selection criterion displays all relationships/links of batches that currently have this identifier.

Field Descriptions

Graphic batch tracing

Batch number

Display of the batch numbers, including batches that entered and output batches in a tree structure.

Material number

Shows the material number for the batch.

Material designation

Displays the material name for the batch.

Detail application "Batch tracing"**Order**

Order number of the selected batch

Workplace

Workplace number of the selected batch

Short name

Short designation of the workplace of the selected batch

Designation

Workplace designation of the selected batch

Input batch

Input batch pertaining to the selected batch

Output batch

Output batch pertaining to the selected batch

Logon

Logon time of the selected batch

Logoff

Logoff time of the selected batch

Detail application "Batch information"**Batch number**

Batch number of the selected batch. This number may exist several times in the system.

Internal batch number

System-wide unique batch number of the selected batch.

Material

Material number of the selected batch

Material designation

Material designation of the selected batch

Batch status

Batch status of the selected batch

Material type

[Material type](#) of the selected batch

Person

Person associated with the selected batch

Status change

Date of the most recent status change of the selected batch

Quantity

Original quantity of the selected batch

Manufacturing date

Manufacturing date of the selected batch

Remaining quantity

Current remaining quantity of the selected batch

Availability date

Availability date of the selected batch

Unit

Quantity unit of the selected batch

Expiration date

Expiry date of the selected batch

Detail application "batch attributes"**Designation**

Designation

Value

"Batch history" detailed application

Past events recorded for the batch are shown in this detailed application. The detailed application is identical to the main application "batch history".

This detail application provides the possibility to trace back events about demounting/mounting components for a superordinate batch (serial number). But the main application does not provide this function.
