

1 AIP Add-On Task Switching

AIP display

AIP allows for the integration of buttons starting third-party applications in all toolbars. These buttons

- start third-party applications if they are inactive
- bring third-party applications to the front when they are running

The customer is responsible for proper installation and functioning of third-party applications.

Configuration of the first button

In order to call up an external program, it must be entered in the section *[ext. software]* of the *ctaip.ini* file:

ProgFileName

The path and file name of the program to be requested are defined here.

WindowName

The string entered in this field is used to check in the process list if the application has already been started. If this is the case, the running application is brought to the front.

SearchParts=On

This option defines that not the entire process name must match the entered *WindowName*. It is sufficient if it includes the *WindowName*.

If further external programs should be started, a number (starting with 2) must be added to the relevant entries.

Example:

```
[ext. software]
ProgFileName=c:\Windows\notepad.exe
WindowName=Notepad
SearchParts=On
ProgFileName2=c:\Windows\System32\mspaint.exe
WindowName2=Paint
SearchParts2=On
```

Starting external programs is similar to starting dynamic dialogs (see previous chapter). *Identifiers* for external programs are "USER1" for the 1st entry and "USER2" to "USER9" for the entries that follow:
