

1 Scrap Statistics

Overview

The scrap statistics provide a tool that allows not only the scrap quantity to be reported, but also all of the scrap reasons that applied during a selected period. In it, scrap recorded automatically is considered in the evaluation. The scrap statistics use graphic illustrations to provide the user with a hit list of the most frequent scrap reasons.

Integration

The order-related log records for the record type "T" form the data basis used to display quantities in the scrap statistics. These are generated as a result of manual partial confirmations during OP interruptions or log-offs (if quantities are entered in the process) or are caused by automatic entry of scrap quantities.

Selection criteria

The application provides the following selection criteria:

Workplace from ... to ...

Select the log records posted to the workplace that was entered, the responsibility area of which the user has authorized rights to. You can also run a search using wildcards in the field.

Group from ... to ...

Select the log records posted to the workplace that was entered, the responsibility area of which the user has authorized rights to, and that are assigned to the entered group. You can also run a search using wildcards in the field.

Cost center

Select the log records posted to the workplace that was entered, the responsibility area of which the user has authorized rights to, and that are assigned to the entered cost center. You can also run a search using wildcards.

Date from ... to ...

The time period entered restricts the selection by log records. Select the log records that have a posted shift date or login date within the defined period.

The preset value is "Today minus 7 days" to "Today". The date is calculated based on the Gregorian calendar.

Shift 1, 2, 3, 4

Within the entered period, only those log records are selected that are assigned to the shift entered according to the shift model.

Operations that are logged in during the currently running shift at the time the data are selected are not considered, because no log records have been generated for them yet.

Time from ... to ...

The time period entered restricts the selection by log records. Select the log records that have a start date within the defined period. The preset value is from "12.00 AM" to "11.59 pm".

Scrap statistics

The scrap statistics detail application generates a table view of all of the scrap reasons accrued over a selected period of time along with the scrap quantity. The order-related log records for the record type "T" form the data basis for the selection. The quantities calculated generally relate to the primary quantity unit. When these are summed up, the different quantity units are not converted.

In the scrap statistics, only operations are displayed that posted at least one partial confirmation with scrap during the evaluation period.

The following fields are displayed in the table:

Workplace

Workplace number

Order

Order number of the order/ operation.

Operation

Operation number for the operation

Article

Article number of the operation.

Reason

Unique number for a stored scrap reason.

Scrap reason

Designation for a scrap reason.

Scrap (P)

The scrap column shows the scrap quantity relating to scrap reason, workplace and order/ operation.

Please keep in mind that the scrap quantity shown may also be negative in certain constellations. This can be the case, for example, if scrap is offset against yield.

Scrap rate

Proportion of scrap (primary quantity unit) as compared to the total quantity produced (primary quantity unit) for an operation during the evaluation period.

The term total quantity is understood as the sum total of all four quantity accounts (yield, scrap, rework, open quantity). Please keep in mind that the rework quantity and open quantity is not shown in the scrap statistics.

Calculation:

$$\text{Scrap rate} = 100.0 * \text{Scrap} / (\text{yield} + \text{scrap} + \text{rework} + \text{open quantity})$$

Graphic scrap statistic

After values have been collected to be shown in a chart, a menu item "Graphic scrap statistic" will appear to the left of the menu item. The following graphics are displayed after this detail application has been called up:

Comparison yield - scrap detail application graphic

This detail application provides a comparison of the yield and scrap quantity shown in the form of a bar chart. In it, the bars represent the relationship between the two quantity types.

Scrap hit list (scrap reasons) graphic

The scrap hit list (scrap reasons) is a compilation of the recorded scrap quantities, grouped by scrap reason and shown in graphic form. The bar chart shows in each bar one cumulative value for each scrap reason and the proportion in percent based on the total scrap quantity calculated in the evaluation period.

Scrap hit list (workplaces) graphic

The scrap hit list (workplaces) is a compilation of the recorded scrap quantities, grouped by workplace/ machine and shown in graphic form.

The bar chart shows in each bar one cumulative value for each scrap reason for all highlighted entries and the proportion in percent based on the total scrap quantity calculated in the evaluation period.
