

Archiving Data - Incentive Wage

Overview

In the module LLE (incentive wage) data is stored for 100 days by default before their transfer to the long-term area.

You can access data from the long-term area for different evaluations. They are largely accessed automatically if the selection period exceeds the short-term data area. In a few applications, we provide the option "Consider long-term data" in the selection area and it is used to access that data.

Configuration

You can setup data retention in the database using [Data management](#). The request to delete data is run from a central archiving script hyarc.scr. This program is planned to run on a daily basis within the [Scheduler](#) by default.

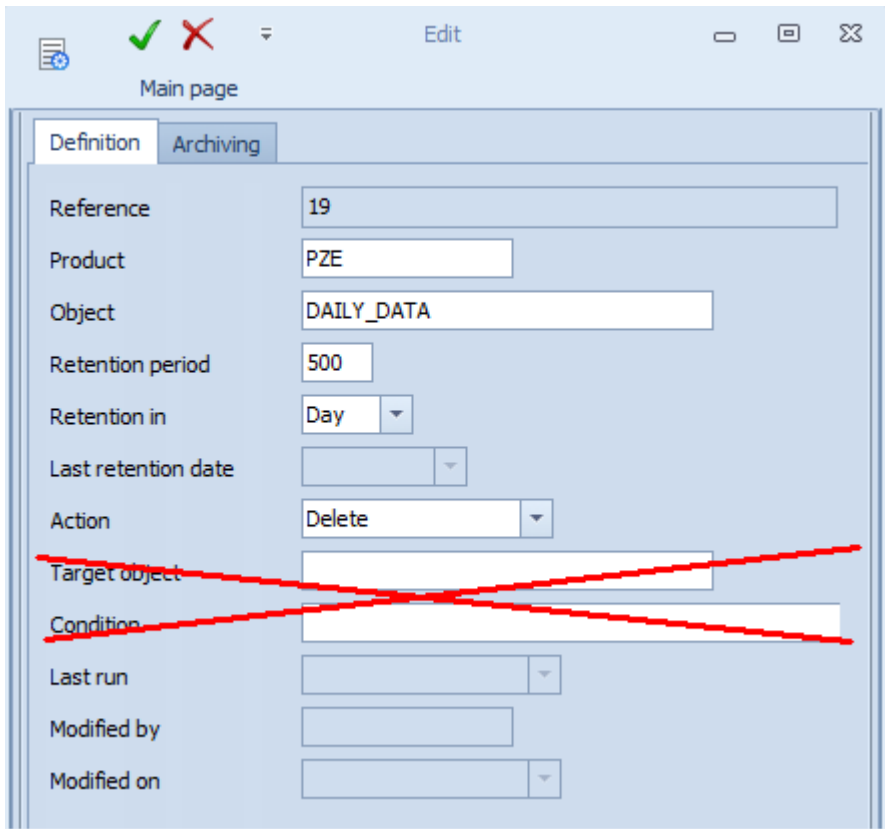

Product	Object	Object name	Perform	Default interval
LLE	DATA	Personnel day result Daily group performance Monthly group performance Labor time comparison Bonuses	Online dataset -> Long term area	100 days
LLE	A_DATA	Personnel day results Daily group performance Monthly group performance Premium group changes Premium group Wage type determination Labor time comparison Bonuses	Data in the long-term area is deleted.	400 days

Restrictions

The data management for LLE is restricted in its functionality compared to other products groups that have increased archiving functions.

- Default action is "**Delete**".
- The default action is "**Export**" introduced with Service Pack 7. Data is exported into text files into the HYDRA server. MPDV offers a special service where data is checked and if necessary retrieved. To retrieve exported data by the customer using the reload manager, for example, is not possible.
- Data retention can only be configured per product/object. Deviating settings for individual database tables are not available.

- Using field like "**Target object**" and "**Condition**" are not permitted.
