

1 Splitting Batches

Summary

The "split batch" function can be used to divide an existing batch into several individual batches. The following "batch types" may be split:

- "simple" batch (split off quantities with new batch numbers)
- merged batch (split off subordinate batches/serial numbers into new merged batches)

Prerequisite

In general, all batches to be split off have to be available.

The "split batch" function can only be applied to batches meeting the below-mentioned conditions:

- only batches in the batch status "free" may be split
- only batches assigned the batch class "yield" may be split

Variants

In general, there are the following two variants to split batches.

- [Splitting batches at AIP](#)
AIP provides a function to split the entered batches/merged batches into several batches/merged batches. A label may be printed each for the batches/merged batches split off.

The function is only available if the modification [batch_split](#) is enabled.

- [Splitting batches at MOC](#)
The MOC batch data overview provides a function to split the entered batches/merged batches into several new batches/merged batches.

The "split merged batches" function is only available if the modification [batchsplitextension](#) is enabled.

Result

The below-mentioned results can be expected after splitting batches at AIP or MOC:

Splitting "simple" batches:

- the batches split off include the entered quantity
- the batches split off are assigned the status "free"
- If no remaining quantity is available, the old batch is in the "free" or "processed" status.
- The old batch has the batch class "yield"
- the batch number of the old batch:
 - is a new batch number
 - is the original batch number

Splitting merged batches:

- the merged batches split off include the selected subordinate batches/serial numbers and the relevant quantity.
- the merged batches split off are assigned the status "free"
- If no remaining quantity is available, the old merged batch is in the "free" or "processed" status.
- the old merged batch is assigned the "yield" batch class and includes all subordinate batches/serial numbers that have not been split off and/or no subordinate batches/serial numbers if all of them were split off.
- the batch number of the old merged batch:
 - is a new batch number
 - is the original batch number
