

1 Workflow - Internal Complaint

1.1 Usage

This is the description of the standard workflow process to be used for processing internal complaints.

The workflow is administered under the name `HYDRA_complaint_internal`.

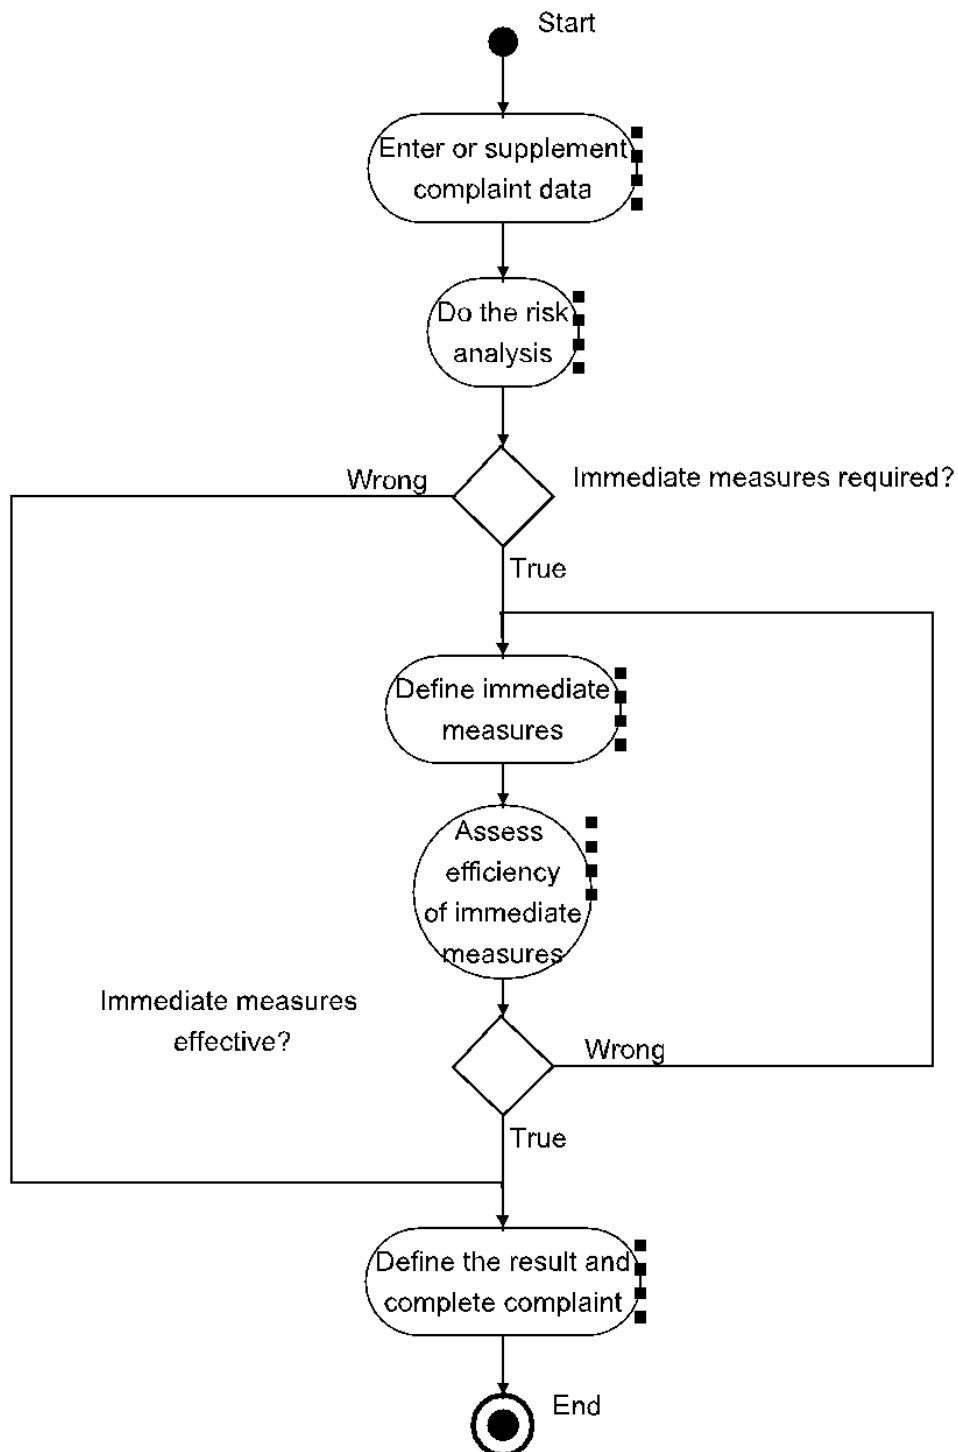

A workflow based on the process described here is instantiated when a complaint of the type "internal complaint" is created.

In the course of customizing, other workflow processes deviating from the standard could also be instantiated upon the creation of internal complaints.

1.2 Process Chart

1.2.1 Overview

Identification of Addressee of Relevant Task

Upon activation of a process step for which a generic task has been defined, the addressee of this task is identified on the basis of the responsible person defined in the associated complaint at that time.

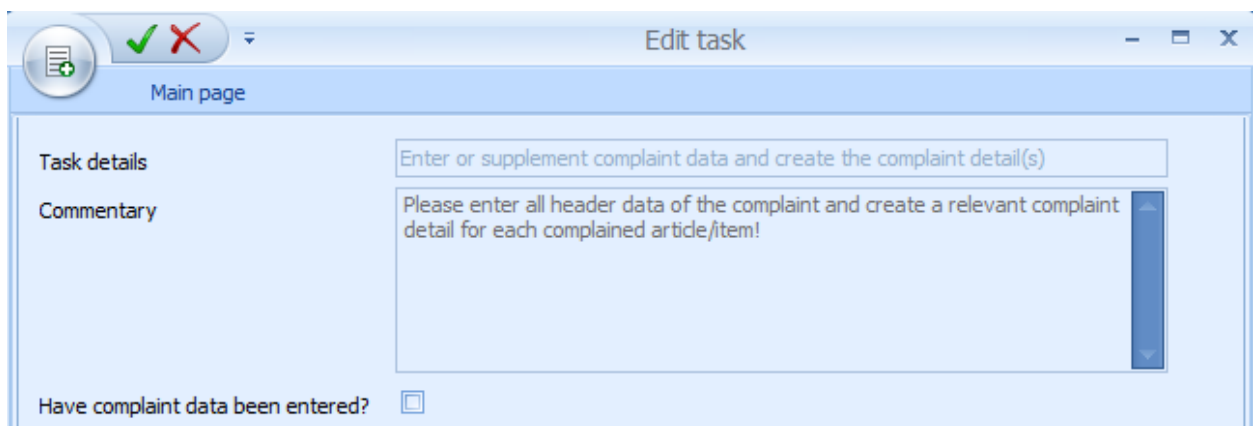

For this purpose, the type and ID are read first. The addressee is identified as follows according to the type:

- *Responsible person of type "external person":*
A workflow user whose logon name corresponds with the ID of the external person is searched.
- *Responsible person of type "person":*
At first, a HYDRA user is searched who was assigned the ID of the person responsible for the complaint in the "Person" field. Following this, a workflow user is searched whose logon name corresponds with the HYDRA user found.
- *Responsible persons of all other types:*
Using the ID of the person responsible for the complaint, a group is searched in the workflow management system.

Should problems occur regarding the determination of detail data, or should the searched workflow user and/or the group not exist, the group "COMPLAINT_MANAGER" is used as addressee.

1.2.2 Process Step "Entry and/or completion of complaint data"

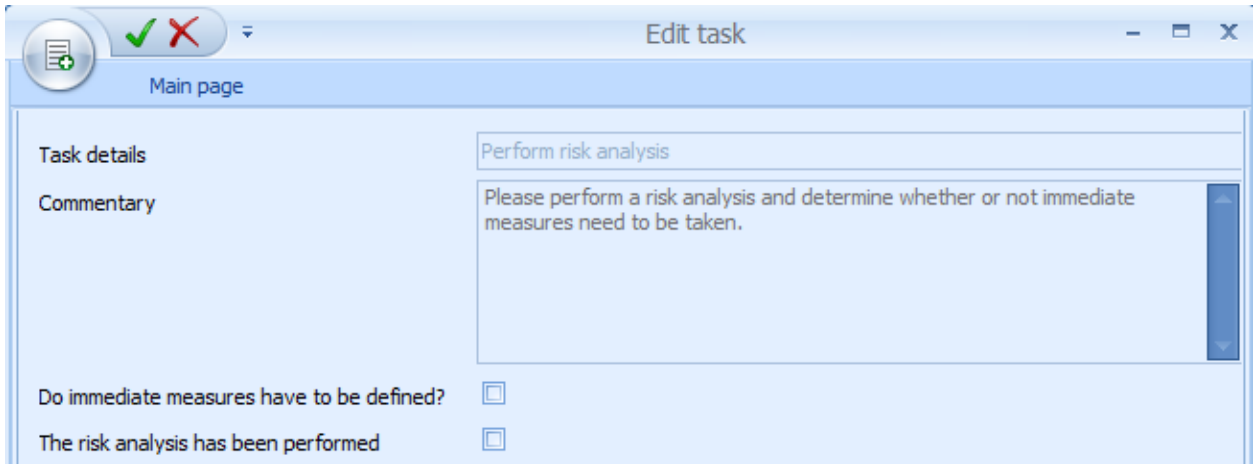

Activating this process step will create a task. The recipient of the task is notified by e-mail.

The workflow is not continued until completion of this task has been documented by activating the checkbox "Have complaint data been entered?".

1.2.3 Process Step "Perform risk analysis"

Activating this process step will create a task. The recipient of the task is notified by e-mail.

The screenshot shows the 'Edit task' window with the title bar 'Edit task'. Below the title bar is a 'Main page' tab. The window is divided into two main sections: 'Task details' and 'Commentary'. In the 'Task details' section, the task name is 'Perform risk analysis'. In the 'Commentary' section, there is a text box containing the instruction: 'Please perform a risk analysis and determine whether or not immediate measures need to be taken.' Below the commentary, there are two checkboxes: 'Do immediate measures have to be defined?' and 'The risk analysis has been performed', both of which are currently unchecked.

In accordance with the status of the checkbox "Do immediate measures have to be defined?", it is decided at the time of task completion whether to proceed in this regard or whether there is a ramification for determining the complaint findings.

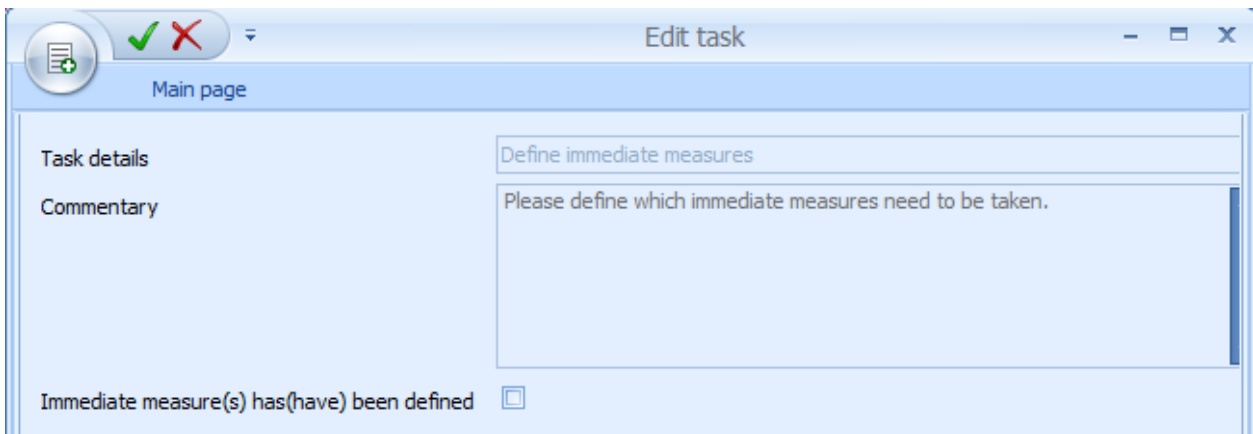

The workflow is not continued until completion of this task has been documented by activating the checkbox "The risk analysis has been performed".

1.2.4 Ramification "Immediate measures required?"

In accordance with the selection in the checkbox "Do immediate measures have to be defined?" in the previous process step, either clarification with the customer is proposed or there is a ramification for verification of all data concerning complaint handling.

1.2.5 Process Step "Define immediate measures"

Activating this process step will create a task. The recipient of the task is notified by e-mail.

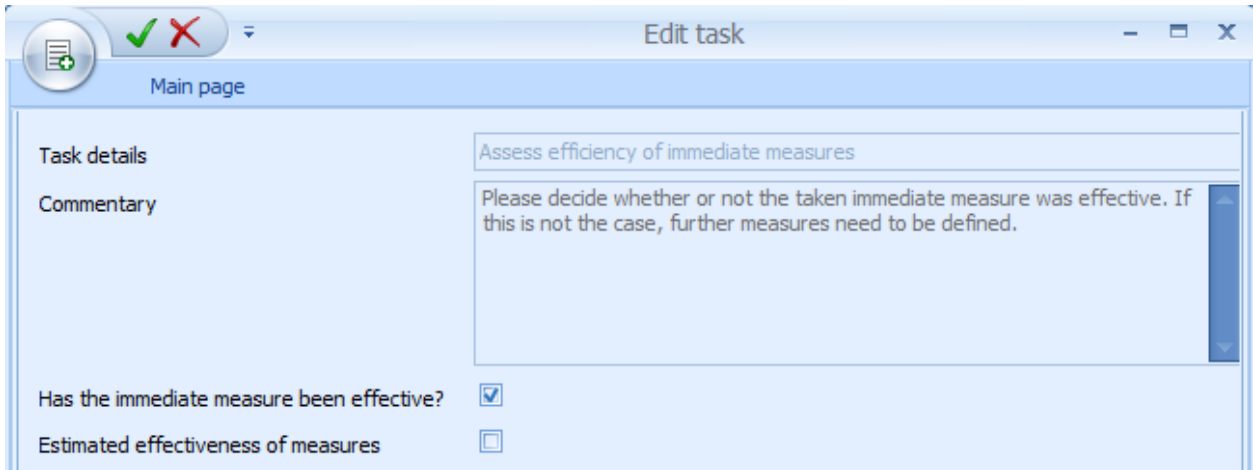

The screenshot shows the 'Edit task' window with the title bar 'Edit task'. Below the title bar is a 'Main page' tab. The window is divided into two main sections: 'Task details' and 'Commentary'. In the 'Task details' section, the task name is 'Define immediate measures'. In the 'Commentary' section, there is a text box containing the instruction: 'Please define which immediate measures need to be taken.' Below the commentary, there is a checkbox labeled 'Immediate measure(s) has(have) been defined', which is currently unchecked.

The workflow is not continued until completion of this task has been documented by activating the checkbox "Immediate measure(s) has/have been defined".

1.2.6 Process Step "Determine effectiveness of immediate measures"

Activating this process step will create a task. The recipient of the task is notified by e-mail.

In accordance with the status of the checkbox "Has the immediate measure been effective?", it is decided at the time of task completion whether additional immediate measures are to be defined or whether there is a ramification for determining the complaint findings.

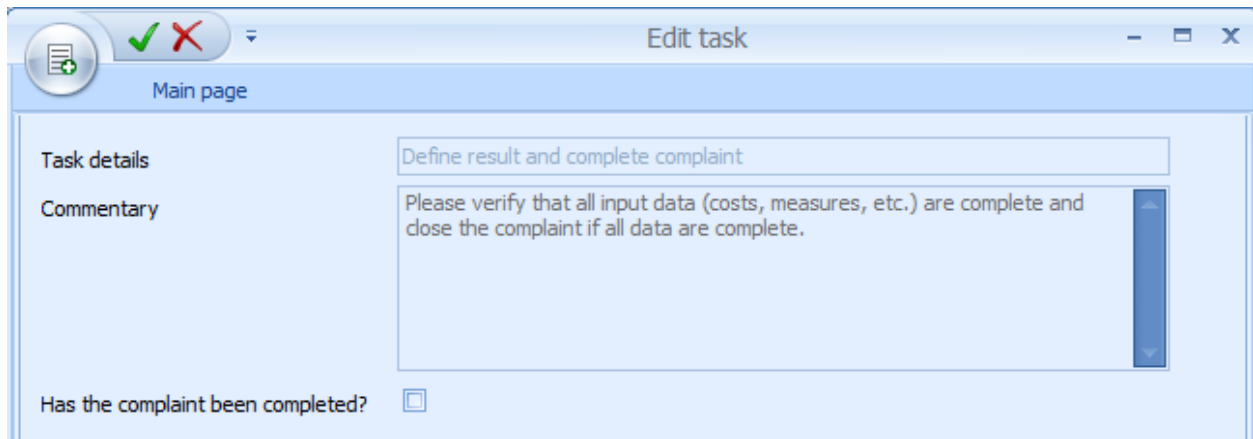

The workflow is not continued until completion of this task has been documented by activating the checkbox "Measure effectiveness assessed?".

1.2.7 Ramification "Immediate measures effective?"

In accordance with the selection in the checkbox "Has the immediate measure been effective?" in the previous process step, either you return to the definition of immediate measures or you proceed with a verification of all data concerning complaint handling.

1.2.8 Process Step "Determination of findings and completion"

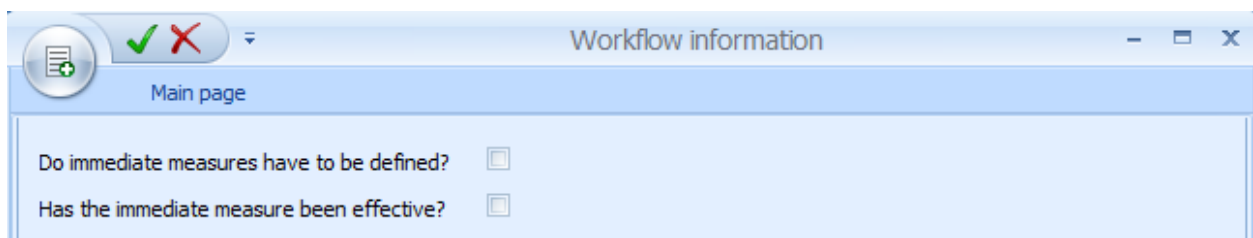

Activating this process step will create a task. The recipient of the task is notified by e-mail.

The workflow is finished when completion of this task has been documented by activating the checkbox "Has the complaint been completed?".

1.2.9 Display of Workflow Information

The workflow information function will display all information which has been defined in workflow processing and has an effect on ramifications in the workflow.

The meaning of the elements in this display is explained in the context of the relevant process steps where this information is available for entry.

All information is made available as read-only information at this point.

1.3 Integration

Upon creation of an internal complaint, an active entry of the object type `WFM_CONFIG` with parameter `Complaint_ComplaintType_INTERN` is searched in the advanced object configuration of HYDRA. The parameter "Object ID 1" of this entry is interpreted as the name of the process definition to be used (by default: `HYDRA_complaint_internal`). The parameter "Object ID 2" of the entry found is interpreted as the version of the process definition to be used.

These parameters can be used to create a new workflow event. Its key fields are assigned as follows:

Key field	Contents
Module	COMPLAINT
Designation	Workflow for complaint
Process alias name	Complaint_ComplaintType_INTERN
Process name	Name of process definition (result of the previously described search)
Process version	Version of process definition (result of the previously described search)
ID 1	Internal number of internal complaint
ID 2	Empty
ID 3	Empty
ID 4	Empty
ID 5	Empty
Key 1	Data type of internal complaint (default: REK)
Key 2	Area of internal complaint
Key 3	Empty
Key 4	Empty

Key 5	Empty
Data	var_HYDRA_rectype=<Data type of complaint> var_HYDRA_ber=<Area of complaint> var_HYDRA_reknr=<Internal number of customer complaint>

Subsequently, an attempt is made to instantiate a workflow on the basis of the previously identified name of the process definition and its version. Should this fail, the process event will provide an indication of the cause.

If instantiation of the workflow was successful, the workflow variables `var_HYDRA_rectype`, `var_HYDRA_ber` and `var_HYDRA_reknr` may be used to generate the reference to the associated internal complaint directly.
