

1 Workflow - Internal Complaint Detail

1.1 Usage

This is the description of the standard workflow process to be used for processing internal complaint details.

The workflow is administered under the name `HYDRA_complaintdetail_internal`.

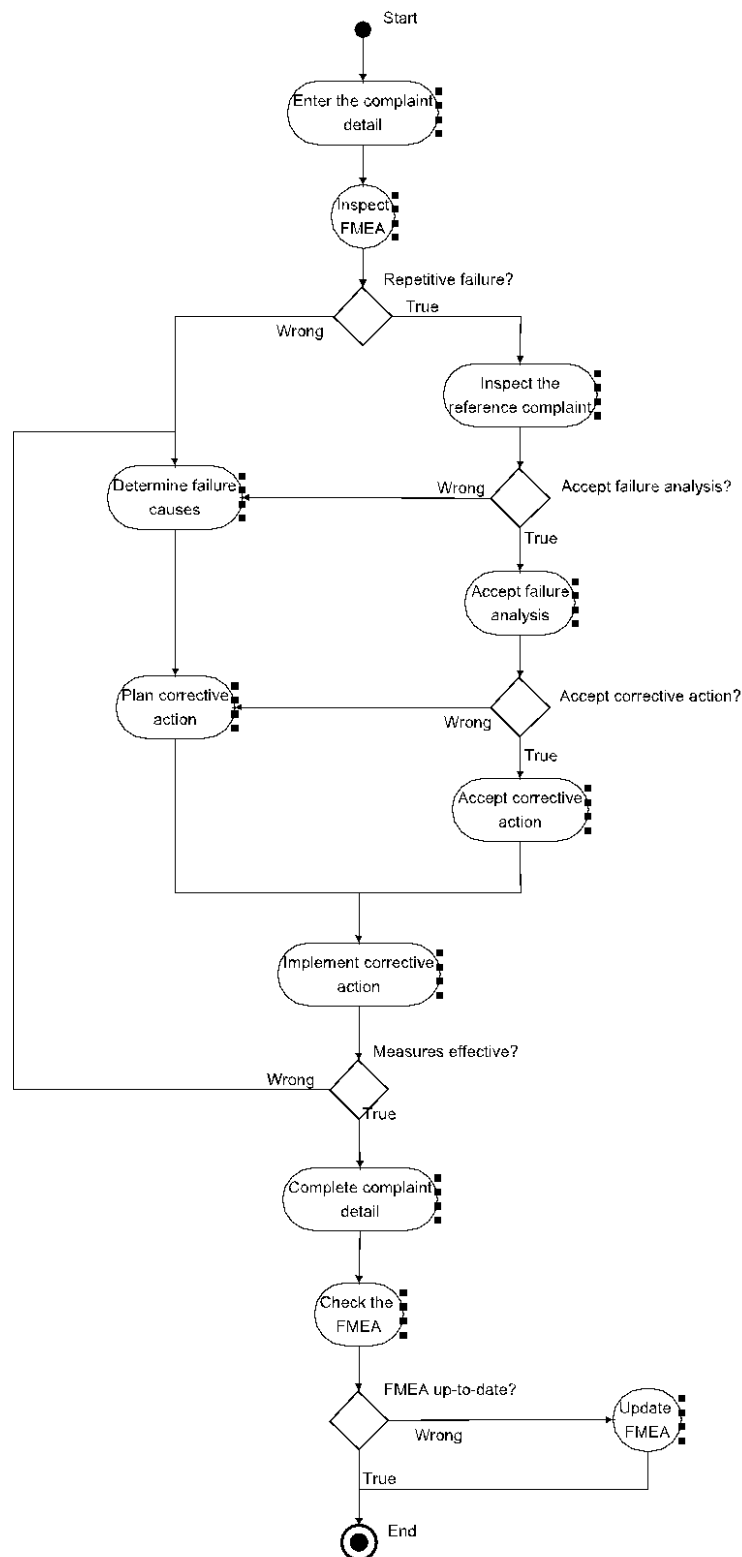

A workflow based on the process described here is instantiated when a complaint detail for a complaint of the type "internal complaint" is created.

In the course of customizing, other workflow processes deviating from the standard could also be instantiated upon the creation of internal complaint details.

1.2 Process Chart

1.2.1 Overview

Identification of Addressee of Relevant Task

Upon activation of a process step for which a generic task has been defined, the addressee of this task is identified on basis of the responsible person defined in the associated complaint detail at that time.

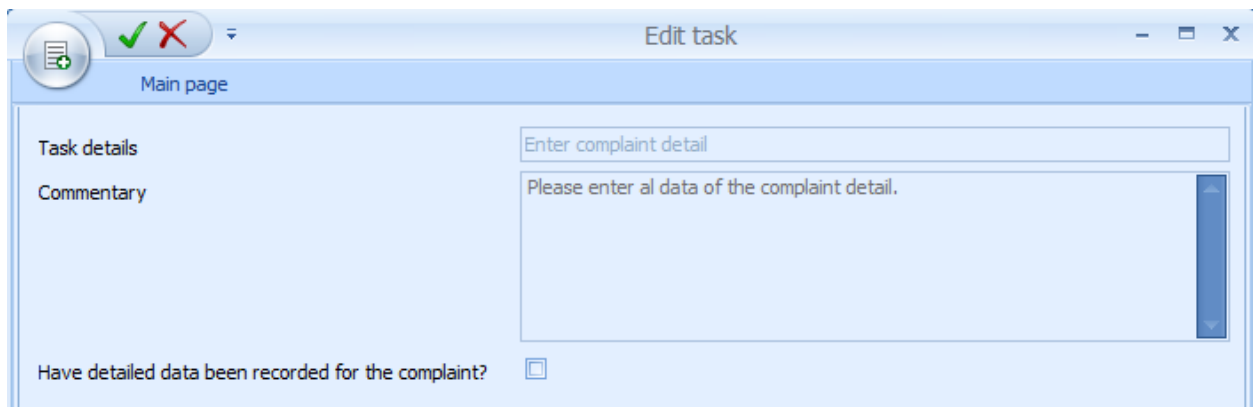

For this purpose, the type and ID are read first. The addressee is identified as follows according to the type:

- *Responsible person of type "external person":*
A workflow user whose logon name corresponds with the ID of the external person is searched.
- *Responsible person of type "person":*
At first, a HYDRA user is searched who was assigned the ID of the person responsible for the complaint detail in the "Person" field. Following this, a workflow user is searched whose logon name corresponds with the HYDRA user found.
- *Responsible persons of all other types:*
Using the ID of the person responsible for the complaint detail, a group is searched in the workflow management system.

Should problems occur regarding the determination of detail data, or should the searched workflow user and/or the group not exist, the group "COMPLAINT_MANAGER" is used as addressee.

1.2.2 Process Step "Entry of complaint detail"

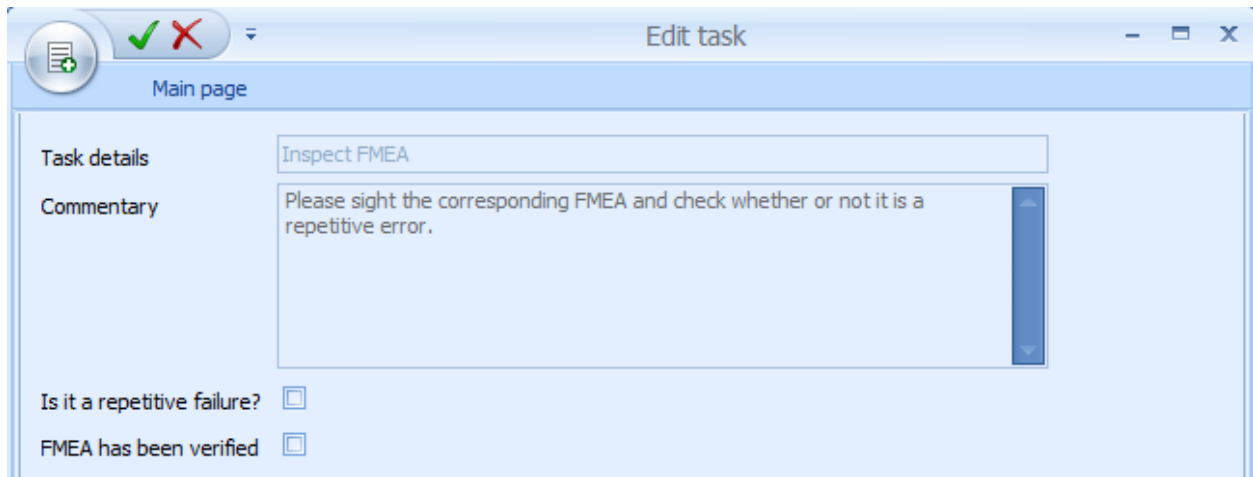

Activating this process step will create a task. The recipient of the task is notified by e-mail.

The workflow is not continued until completion of this task has been documented by activating the checkbox "Have the complaint detail data been entered?".

1.2.3 Process Step "FMEA verification"

Activating this process step will create a task. The recipient of the task is notified by e-mail.

In accordance with the status of the checkbox "Is it a repetitive failure?", it is decided at the time of task completion whether a reference complaint is to be searched from which the failure analysis and remedial action may be adopted.

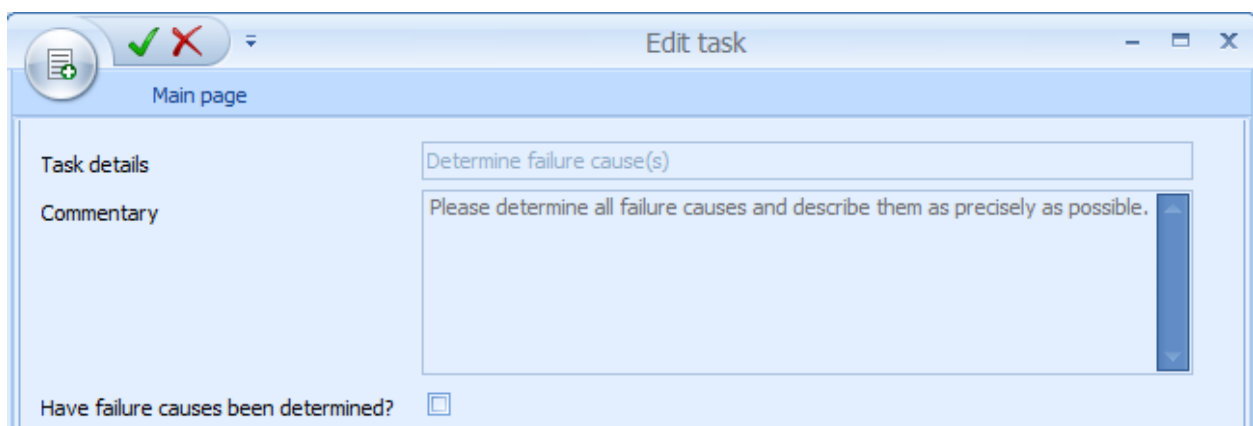

The workflow is not continued until completion of this task has been documented by activating the checkbox "Has FMEA been verified?".

1.2.4 Ramification "Repetitive failure?"

In accordance with the selection in the checkbox "Is it a repetitive failure?" in the previous process step, there is a ramification either to the verification of a reference complaint or to determining the failure cause.

1.2.5 Process Step "Determine failure causes"

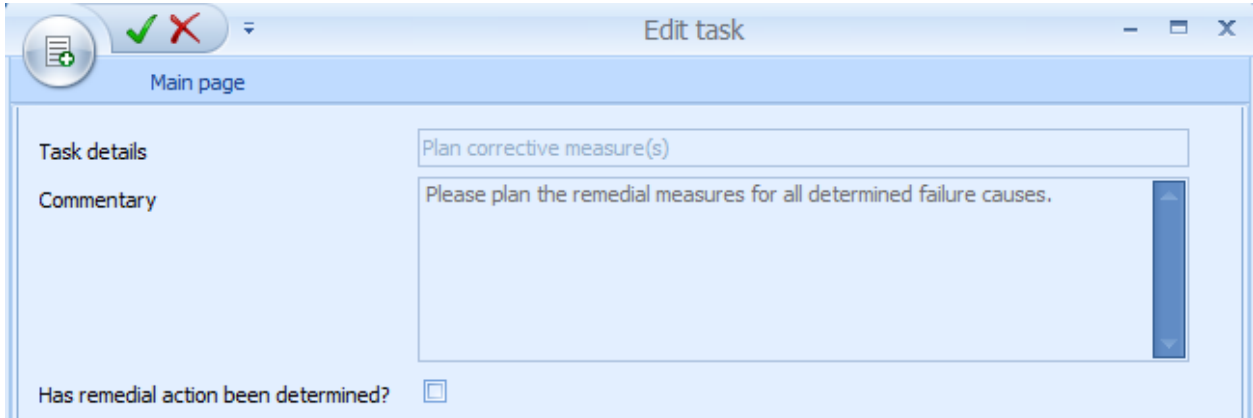

Activating this process step will create a task. The recipient of the task is notified by e-mail.

The workflow is not continued until completion of this task has been documented by activating the checkbox "Have failure causes been determined?".

1.2.6 Process Step "Planning of remedial action"

Activating this process step will create a task. The recipient of the task is notified by e-mail.

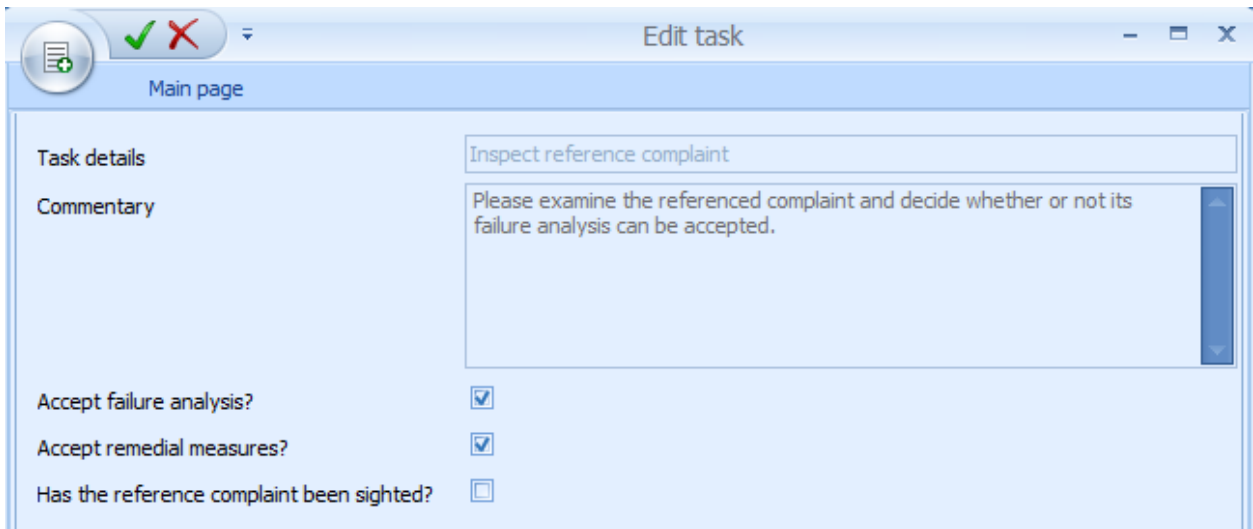

The screenshot shows a web application window titled "Edit task". At the top, there is a navigation bar with a "Main page" link and a status bar with a green checkmark, a red X, and a dropdown arrow. The main content area is divided into two sections: "Task details" and "Commentary". The "Task details" section contains a text input field with the placeholder text "Plan corrective measure(s)". The "Commentary" section contains a text area with the text "Please plan the remedial measures for all determined failure causes." Below these sections, there is a checkbox labeled "Has remedial action been determined?" which is currently unchecked.

The workflow is not continued until completion of this task has been documented by activating the checkbox "Has remedial action been determined?".

1.2.7 Process Step "Reference complaint verification"

Activating this process step will create a task. The recipient of the task is notified by e-mail.

The screenshot shows a web application window titled "Edit task". At the top, there is a navigation bar with a "Main page" link and a status bar with a green checkmark, a red X, and a dropdown arrow. The main content area is divided into two sections: "Task details" and "Commentary". The "Task details" section contains a text input field with the placeholder text "Inspect reference complaint". The "Commentary" section contains a text area with the text "Please examine the referenced complaint and decide whether or not its failure analysis can be accepted." Below these sections, there are three checkboxes: "Accept failure analysis?" (checked), "Accept remedial measures?" (checked), and "Has the reference complaint been sighted?" (unchecked).

The checkboxes "Accept failure analysis?" and "Accept remedial action?" will determine whether the relevant detail information from the reference complaint is adopted or is to be determined separately at a later point in time.

If the failure analysis cannot be adopted, remedial action must also be planned (regardless of the checkbox "Adopt remedial action?"). The reason for this is that remedial action must match the failure analysis. To ensure this, adoption of the remedial action is prevented if the failure analysis is not adopted.

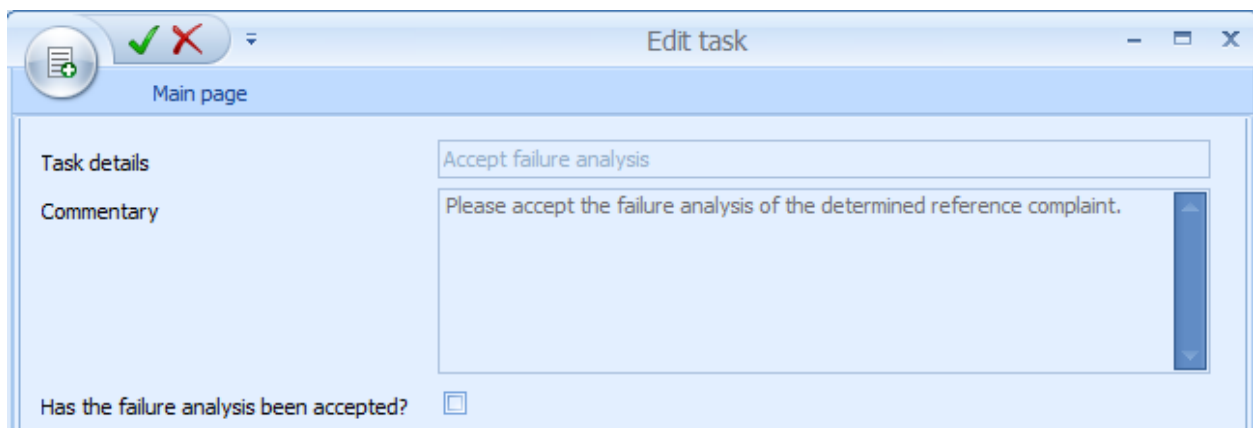

The workflow is not continued until completion of this task has been documented by activating the checkbox "Has the reference complaint been verified?".

1.2.8 Ramification "Accept failure analysis?"

In accordance with the selection in the checkbox "Adopt failure analysis?" in the process step "Reference complaint verification", there is a ramification to adopting the failure analysis or to determining the failure causes.

1.2.9 Process Step "Accept failure analysis"

Activating this process step will create a task. The recipient of the task is notified by e-mail.

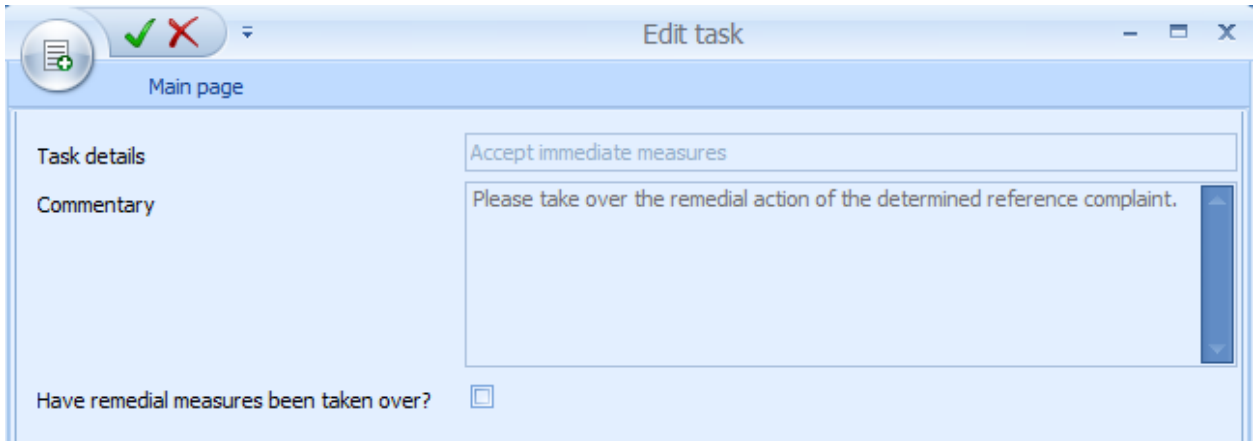

The workflow is not continued until completion of this task has been documented by activating the checkbox "Has the failure analysis been accepted?".

1.2.10 Ramification "Adopt remedial action?"

In accordance with the selection in the checkbox "Adopt remedial action?" in the process step "Reference complaint verification", there is a ramification to adopting the remedial action of the reference complaint or to planning remedial action.

1.2.11 Process Step "Adopt remedial action"

Activating this process step will create a task. The recipient of the task is notified by e-mail.

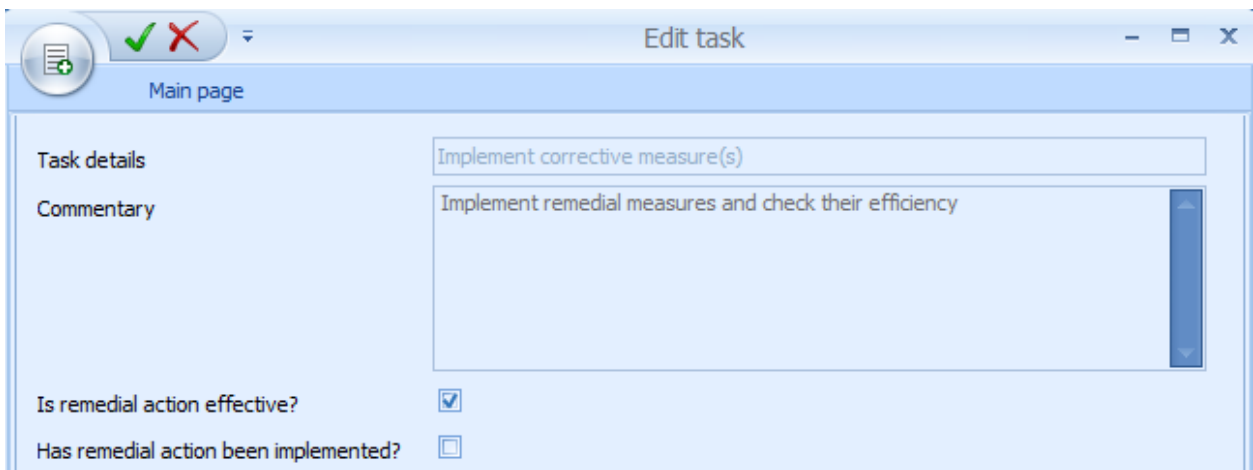

The screenshot shows a web application window titled "Edit task". At the top, there is a toolbar with a green checkmark, a red X, and a dropdown arrow. Below the toolbar is a "Main page" header. The main content area is divided into two sections: "Task details" and "Commentary". In the "Task details" section, there is a text input field containing "Accept immediate measures". In the "Commentary" section, there is a text area containing "Please take over the remedial action of the determined reference complaint." At the bottom of the window, there is a checkbox labeled "Have remedial measures been taken over?" which is currently unchecked.

The workflow is not continued until completion of this task has been documented by activating the checkbox "Has remedial action been adopted?".

1.2.12 Process Step "Implementation of remedial action"

Activating this process step will create a task. The recipient of the task is notified by e-mail.

The screenshot shows a web application window titled "Edit task". At the top, there is a toolbar with a green checkmark, a red X, and a dropdown arrow. Below the toolbar is a "Main page" header. The main content area is divided into two sections: "Task details" and "Commentary". In the "Task details" section, there is a text input field containing "Implement corrective measure(s)". In the "Commentary" section, there is a text area containing "Implement remedial measures and check their efficiency". At the bottom of the window, there are two checkboxes: "Is remedial action effective?" which is checked, and "Has remedial action been implemented?" which is unchecked.

In accordance with the status of the checkbox "Is the remedial action effective?", it is decided at the time of task completion whether you return to determining the failure cause or whether processing is continued.

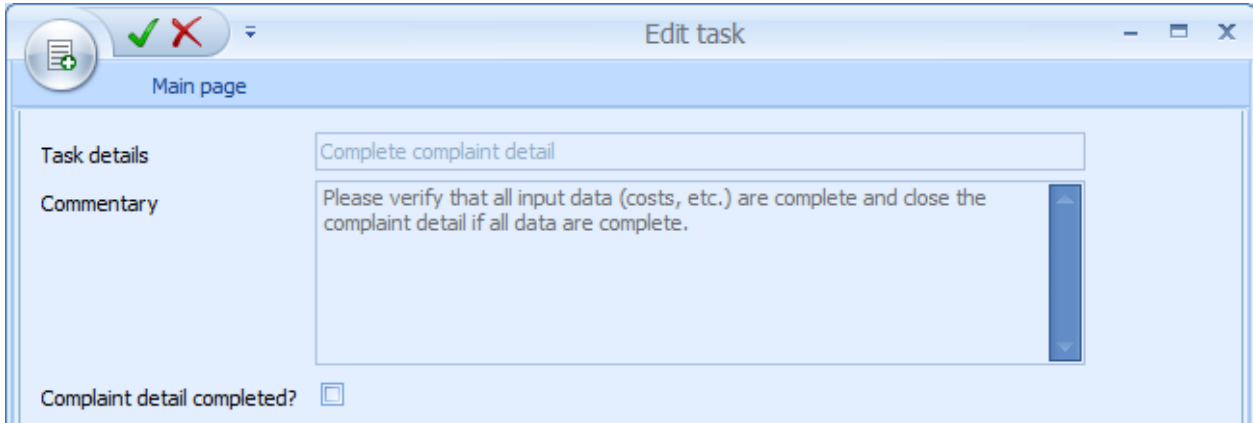

The workflow is not continued until completion of this task has been documented by activating the checkbox "Has remedial action been implemented?".

1.2.13 Ramification "Action effective?"

In accordance with the selection in the checkbox "Is the remedial action effective?" in the previous process step, there is either a ramification to determine the failure cause or completion of the complaint detail is continued.

1.2.14 Process Step "Complete complaint detail"

Activating this process step will create a task. The recipient of the task is notified by e-mail.

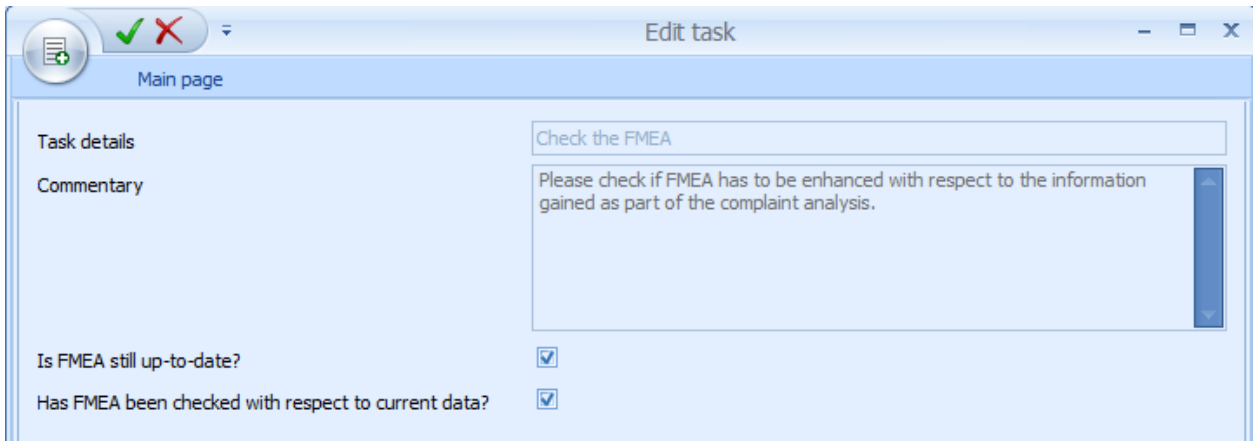

The screenshot shows a web application window titled "Edit task". At the top, there is a "Main page" button and a status bar with a green checkmark and a red X. The main content area is divided into two sections: "Task details" and "Commentary". The "Task details" section contains a text input field with the value "Complete complaint detail". The "Commentary" section contains a text area with the text "Please verify that all input data (costs, etc.) are complete and close the complaint detail if all data are complete." At the bottom of the window, there is a checkbox labeled "Complaint detail completed?" which is currently unchecked.

The workflow is not continued until completion of this task has been documented by activating the checkbox "Has the complaint detail been completed?".

1.2.15 Process Step "FMEA verification"

Activating this process step will create a task. The recipient of the task is notified by e-mail.

The screenshot shows a web application window titled "Edit task". At the top, there is a "Main page" button and a status bar with a green checkmark and a red X. The main content area is divided into two sections: "Task details" and "Commentary". The "Task details" section contains a text input field with the value "Check the FMEA". The "Commentary" section contains a text area with the text "Please check if FMEA has to be enhanced with respect to the information gained as part of the complaint analysis." At the bottom of the window, there are two checkboxes: "Is FMEA still up-to-date?" and "Has FMEA been checked with respect to current data?". Both checkboxes are currently checked.

In accordance with the status of the checkbox "Is FMEA still up-to-date?", it is decided whether you jump to FMEA updating or whether the workflow is to be finished.

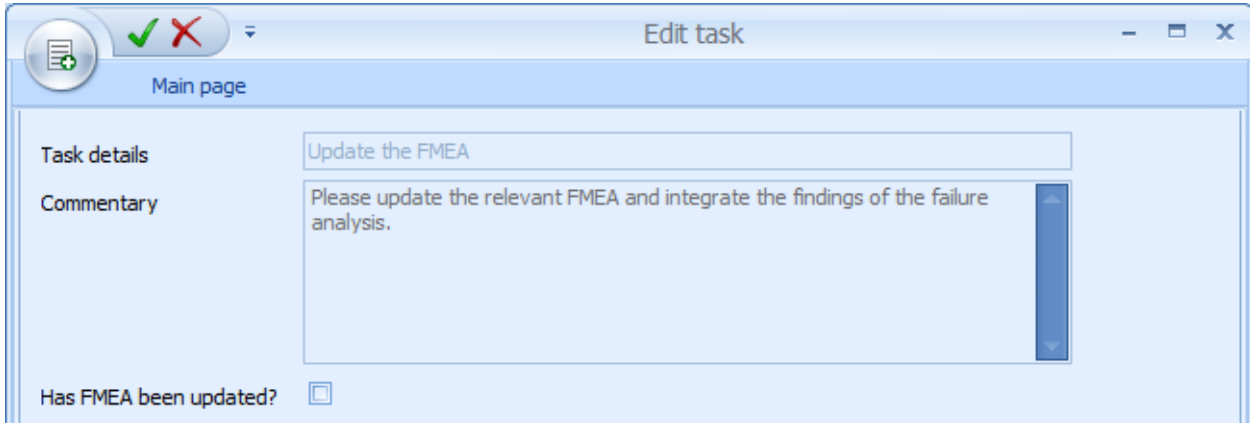

The workflow is not continued until completion of this task has been documented by activating the checkbox "Has FMEA been checked with respect to current data?".

1.2.16 Ramification "Is FMEA still up-to-date?"

In accordance with the selection in the checkbox "Is FMEA still up-to-date?" in the previous process step, there is a ramification to updating FMEA or the workflow is finished.

1.2.17 Process Step "Update FMEA"

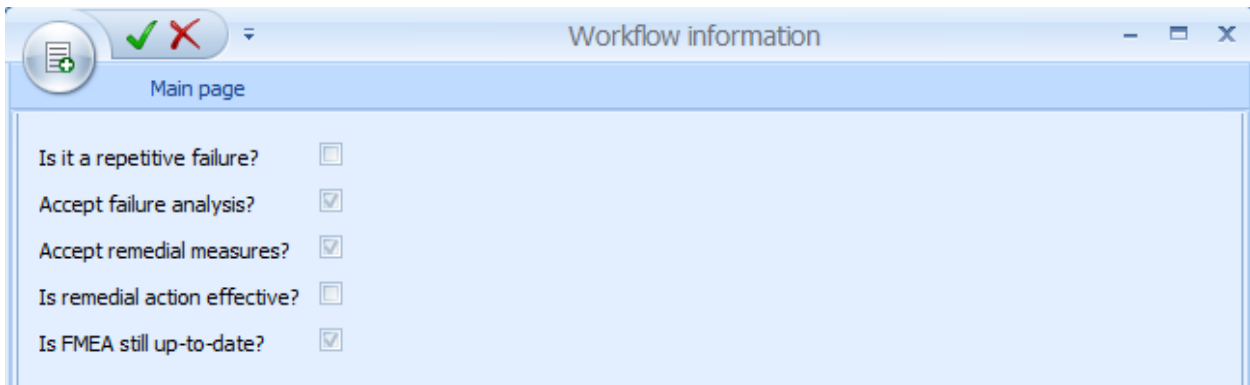

Activating this process step will create a task. The recipient of the task is notified by e-mail.

The workflow is not continued until completion of this task has been documented by activating the checkbox "Has FMEA been updated?".

1.2.18 Display of Workflow Information

The workflow information function will display all information which has been defined in workflow processing and has an effect on ramifications in the workflow.

The meaning of the elements in this display is explained in the context of the relevant process steps where this information is available for entry.

All information is made available as read-only information at this point.

1.3 Integration

Upon creation of an internal complaint details, an active entry of the object type `WFM_CONFIG` with parameter `ComplaintDetail_ComplaintType_INTERN` is searched in the advanced object configuration of HYDRA.

The parameter "Object ID 1" of this entry is interpreted as the name of the process definition to be used (by default: `HYDRA_complaintdetail_internal`). The parameter "Object ID 2" of the entry found is interpreted as the version of the process definition to be used.

These parameters can be used to create a new workflow event. Its key fields are assigned as follows:

Key field	Content
Module	COMPLAINTDETAIL
Designation	Workflow for complaintdetail
Process alias name	ComplaintDetail_ComplaintType_INTERN
Process name	Name of process definition (result of the previously described search)
Process version	Version of process definition (result of the previously described search)
ID 1	Internal number of internal complaint
ID 2	Number of complaint detail
ID 3	Empty
ID 4	Empty
ID 5	Empty
Key 1	Data type of internal complaint (default: REK)
Key 2	Area of internal complaint
Key 3	Empty
Key 4	Empty

Key 5	Empty
Data	var_HYDRA_rectype=<Data type of complaint> var_HYDRA_ber=<Area of complaint> var_HYDRA_reknr=<Internal number of internal complaint> var_HYDRA_rekdetnr=<Complaint detail number>

Subsequently, an attempt is made to instantiate a workflow on the basis of the previously identified name of the process definition and its version. Should this fail, the process event will provide an indication of the cause.

If instantiation of the workflow was successful, the workflow variables `var_HYDRA_rectype`, `var_HYDRA_ber`, `var_HYDRA_reknr` and `var_HYDRA_rekdetnr` can be used to generate the reference to the associated internal complaint detail directly.
