

1 Article

This document describes the “article” application of the Manufacturing Operation Center (MOC). General information on how to use MOC can be found in the document entitled “[moc_cc.pdf](#)”.

The article catalog has been designed to edit/keep articles. Article data is a global catalog that is used in many CAQ modules and in PDV (Process Data Collection). Provided that there is an interface to a higher-level system (e.g. ERP system), articles may be created automatically via this interface. As soon as a new article is created or changed, e.g. in the ERP system, the article data record is automatically created or changed in the HYDRA-CAQ article catalog based on the defined information.

1.1 Function call

Menu	Master data → Quality management → Article Master data → Process data processing → Article
Transaction code	atc
Function authorization	atc

Available user fields		
Location	Object type/user field key	Source (type)
Table and detail view	ATK/SYSTEM	MF-D
How can I configure user fields? Which user field types are available?		

1.2 Default Application Layout

1.3 Toolbar

The toolbar provides the different functions available for this application and possibly links to other applications. The functions included in the “general” tab of the toolbar are available in all detail applications. In addition to the standard functions, such as help, request data, save application settings, and print preview, the other tabs also include specific functions that are specially tailored to the respective detail application. The following sections describe the individual application functions.

Category Data

Request data

The information to be displayed within the application is requested on the basis of the entered selection criteria. This process might take some time depending on the dataset from which the system filters data and on the selection result to be transferred and displayed.

Cancel

The query sent by clicking the “request data” button can be canceled using this function.

Print preview

The print preview is opened for the selected detail application. The print preview also includes further options to change the resulting printout and functions for exporting the displayed information into other formats, such as PDF, Excel, image files.

Save

The application design configured by the user, e.g. columns and categories displayed as well as their respective size and display locations, etc. are only saved if the user requests it. In this case, the user has to affirm the confirmation prompt by clicking "Yes".

Category Functions

Add

Adds a new article.

Copy

Copies the selected article.

Edit

Edits an already existing article

Delete

Deletes the selected or several selected articles.

Category Help

Help on operation

Clicking this button opens the help file describing how to operate MOC. The basic document is entitled "[moc_cc.pdf](#)". It describes how to use MOC in general and applies for all applications.

Help on application

This function opens the manual for the respective application from which the help file was requested. The application manual integrates the application function into the MES context and explains the information to be displayed. The documentation also includes all detailed applications.

Help on detail application

This function opens the application manual at the section where the relevant detailed application is described.

1.4 Selection parameters

The application provides the following selection criteria:

Tab "General"

- Article no.:
Article number
- Drawing issue number:
Drawing issue number of the article, often also referred to as index
- Designation:
Article name
- Inactive:
Inactive, active articles. The checkbox is not enabled by default.
- Customer article no.:
Customer article number
- Article model:
Article model

Tab "Groups"

- Group:
The article group tree can be opened using the  button if an article group is to be filtered. There is a function to accept and cancel the activity.

1.5 Detail application "Article"

The article number as well as the drawing issue number uniquely identify articles in all areas of HYDRA-CAQ referring to the article catalog. The drawing issue number, also referred to as article index, may be very important, in particular, for inspection planning and when inspection orders are generated. Thus, it is, for example, possible to create an inspection plan for the article 12938 with the drawing issue numbers A and B. Different inspection specifications apply for each drawing issue no. Unless the drawing issue number is indicated and thus may be part of the inspection plan, the system that generates the inspection requirements, must deliver this drawing issue number.

The fields “article no.” and “drawing issue number” fields are key fields, i.e. when a new article is saved, it is first checked whether an article with this key information already exists.

By distinguishing between active and inactive articles, it may be defined whether or not the articles are available in certain selection lists. Thus, no inspection plan can be created for an inactive article. However, inactive articles may be evaluated at any time. Moreover, inactive articles can also be reactivated at any time.

Furthermore, an article can be defined as being subject to documentation. In addition the dialog provides the fields customer article number, article model, article ABC, drawing number as well as the possibility to assign units. To assign units (dimensions), the catalog of units is used.

If you want to make evaluations on article groups or if you use family inspection plans, it is mandatory to assign the respective group. To assign groups, open the group tree using the lens icon. Using the hierarchic tree entries the required group can be selected in the group tree and accepted by double clicking.

The assigned group including the hierarchical group structure then appears in the “groups” field of the editing dialog of articles.

When articles are displayed in a list, the group hierarchy is represented by the columns “group 1 to group 5”.

Groups are maintained in the “article groups” application and is described in the document entitled [“MOC_Groups.pdf”](#).
