

1 Clocking Authorizations

Summary

Menu	Master Data → People → Clocking Authorizations
Transaction code	clau
Function authorization	clau

Terminal groups and terminals are combined within the “clocking authorizations” dialog to assign corresponding clocking authorizations at HYDRA-PZE terminals.

Utilization

This configuration allows for “clocking authorizations”, which enable clockings at PZE terminals, to be defined for individual people as well as for groups of people. “Clocking authorizations” for employee groups provide the benefit that they normally do not have to be entered every time when a new person is created.

The list of “clocking authorizations” shows all authorizations for the selected people, irrespective of whether authorizations have been defined for individual people for groups of people.

When a person is created, a “clocking authorization” for the terminal group 99 is automatically assigned to this person. These authorizations are only displayed, provided that the terminal group 99 is actually available.

Field Descriptions

Company

The validity of the “clocking authorization” may be restricted to a specific company.

Personnel selection

The next two fields allow for the “clocking authorization” to be restricted to a particular person or a group of people. The HR master fields “cost center”, “area”, “department”, “employee subgroup”, “activity” and “employment relationship” may be selected as employee groups.

Assignment terminal group, terminal

Assignment of the terminal group or terminal for which the clocking authorization is to be assigned.

More flexible planning is granted by using terminal groups instead of terminals. Once a new terminal has been installed, it is sufficient to assign it to one or several terminal groups, without having to assign it to each individual person.

Valid from, until

Validity period of the clocking authorization.
