

1 Analysis of Complaint Costs

Overview

Menu	Quality management → QM evaluation → Analysis of complaint costs Quality management → Complaints management → Analysis of complaint costs
Transaction code	cmcoep
Function authorization	cmcoep

Utilization

The analysis of complaint costs allows for the costs recorded in complaint management to be evaluated. In this context evaluations/reports are based on pivot functions. These functions provide different presentation options, e.g. the number of complaint costs is presented for each complaining party

separated by the cost type and relating to a previously filtered period of time. These analyses help determine the core areas that might require action to be taken.

Integration

The analysis of complaint costs only evaluates data relating to the costs recorded in complaint management. In this context, it is distinguished between the costs in the complaint header and complaint detail including the corresponding detailed information.

Prerequisite

There are no special requirements to be met. Only complaint costs need to be recorded in complaint management including all corresponding detail data.

Selection criteria

Selection criteria are self-explanatory and not described separately.

Toolbar

There are no other special function buttons in addition to the standard functions/features.

Detail applications "Graphic analysis of complaint costs"

Data is displayed in a pivot table in combination with bar charts. Different application functions are provided for the presentation. The complaint costs that have been restricted beforehand by entering selection criteria represent the data basis.

The general pivot functions are not described in more detail in this document. The paragraphs that follow only describe the elementary functions of this evaluation/report.

Pivot evaluations/reports provide the following benefits.

- Large amounts of data may quickly be summarized and presented.
- Rows and columns can be exchanged to have the source data summarized differently.
- Simple filters by "drag and drop" with additional detail filters.
- Due to this interactive way of representation, data can be summarized and analyzed in different formats and using different calculation methods.

The below context menu can be opened by clicking the right mouse button.

The function "show field list" allows for the fields that are to be used in the pivot analysis to be selected.

The below figure shows a possible list of fields.

The requested fields may be put into the evaluation area by drag & drop.

In addition to the selection criteria, the "show filter editor" function enables further flexible restrictions of the data basis.

The below dialog is opened to show the settings made.

The image shows a 'Pivot table settings' dialog box. It has a title bar 'Pivot table settings'. Inside, there are several settings: 'Top N' is set to 3; 'Show others' is unchecked; 'Totals location' is set to 'Far'; 'Chart' is checked; 'Totals' is unchecked; 'Selection' is checked; 'Legend' is checked; 'Columns' is unchecked; and 'Labels' is unchecked.

Pivot table settings	
Top N	3
☐ Show others	
Totals location	Far
☒ Chart	☐ Totals
☒ Selection	☒ Legend
☐ Columns	☐ Labels

If the "selection" option is checked entire areas may be selected in the table view. In this case, the graphic representation is based on the selected rows. If the "label" option is checked it is possible to show the total number of each bar.

The row showing the total result may be displayed additionally in the bar chart if the "totals" option is checked. Provided that the "selection" function is checked and the corresponding cells of the "total result" row are selected, the total result is added to the corresponding column of the relevant bar.

It is switched between the graphic presentation of the corresponding number of columns or rows by checking/unchecking the "columns" option.

Detail application "list of the complaint costs analysis"

The list of the complaint costs analysis shows the complaint costs including referenced data that are filtered on the basis of the used selection criteria. Normally, the referenced data correspond to the field list for the pivot analysis.
