

1 ID Tracing (tabular)

Overview

Menu	Quality management -> Process analysis -> ID tracing (tabular)
Transaction code	ptnt
Function authorization	ptnt

This document describes the application ID Tracing (Tabular) of the Manufacturing Operation Center (MOC).

Purpose

ID Tracing (tabular) enables the tabular presentation and analysis of process values that can be selected referring to search keys (IDs). Search keys are identification tags provided by the machine. They are used to identify measurement tuples instead of or in addition to the machine and time stamps of data collected in the database.

Integration

You have to collect and save measured values based on IDs in order to use this function. TNT configuration is a machine-specific customization of data collection. If you order this type of data collection, the MPDV Customizing Team will implement the new structure. After analyzing and defining the new structure of data collection, MPDV customizes the system accordingly.

Selection parameters

IDs can be selected in the selection panel. The following selection criteria are available in the application:

Tag type:

Identifies the key field. The name of the ID tag.

Tag value

Search value of the selected ID tag.

Machine

Number of the machine as an additional search field. It is required, if the same tags are available at different machines/workplaces.

Time range from - to:

The data selected by the tag value is restricted temporally.

Field descriptions

Apart from the default columns "machine" and "point in time" the table also includes the data columns defined by the respective data structure. The table provides many columns including data values. The IDs and their values are listed in one row.
