

1 Document Management

Summary

Menu	can be started via the menu bar of object-specific applications
Transaction code	n/a
Function authorization	docli

As many documents and/or document links can be assigned to each HYDRA object.

In general, four different link types are available. (They can be maintained via the configuration of document types)

File

The selected file is transferred to the server and retrieved from there for display according to the configured document type and path.

If a document assignment of the link type "File" is deleted, the document file remains in the defined directory. The document file is not deleted.

If an assigned document of the link type "File" is edited and a new file is stated, the file will not be transferred once more to the server. In this case, it is assumed that the file is already stored in the target directory.

Filelink

A file included in a specified directory (according to the configured document type and path) is linked and retrieved from there for display. It is not transferred to the server.

URL

The link type "URL" allows indicating a URL link in order to access a file in the internet or intranet.

Text

The link type "text" enables text to be entered directly.

Utilization

A designation/description can be assigned to each defined document. Once saved, a consecutive item number (numeric) is automatically assigned to each entered document. Provided that no number was entered when the document was assigned initially.

When documents are assigned, all formats registered by Windows are provided. Consequently, it is possible to assign simple documents (e.g. written in Word), drawings of any format and videos. But a suitable program, which can display this format, must be installed. The documents are opened by the program, which was indicated as link in Windows.

Requirements

Relevant document types and, if necessary, their path configuration must be edited/maintained to be able to assign documents.

Selection criteria

The application provides the following selection criteria:

Document type

Selects the document type

Link type

Selects the link type

Name/Description

This selection criterion refers to the name of the assigned document. The wildcard character (placeholder %) can be used. Searching for %Text% reveals all document assignments matching the word "text".

Document type and keys including their values

These selection criteria are assigned by default, always active and cannot be changed. These fields are completed with corresponding criteria subject to the application where the document management function was started.

Field Descriptions

Item

Item number of document assignment. A consecutive number is generated automatically if no item number is entered when the document is assigned initially.

Name/Description

Description of document assignment. It is only used as commentary in HYDRA.

Document type

Shows the document type of the document assignment.

Link type

Shows the link type of the document assignment.

URL link

Here the defined URL path is shown for documents of the link type URL. The file name including sub-directory, if necessary, is shown for the link types FILELINK and FILE.

Text

The defined text is shown here for documents of the type TEXT.

Visible on terminal screen

Shows the assigned document on the AIP terminal.

Terminal user

The terminal number must be entered here if documents are assigned via a terminal.

Created on

Time and date when the document was assigned.

Created by

User who assigned the document. (If assigned via MOC)

Modified by

User who changed the document assignment most recently.

Modified on

Time and date when the document assignment was changed most recently.

Terminal user

The terminal number must be entered here if the assigned document is changed using the terminal.

Toolbar

"General" tab

**Add**

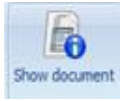

Opens the dialog to add document assignments.

**Edit**

Opens the dialog to edit document assignments.

**Delete**

Deletes document assignments.

**Show document**

If a document link is stored this button opens and shows the linked document. However, a program, which can show the linked file type, has to be installed on the PC.
