

1 Dynamic Modification History relating to Batches

Summary

Menu	Quality management → QM evaluation → Dynamic modification history - batch-related
Transaction code	dynhl
Function authorization	dynhl

The dynamic modification history distinguishes between batch-related and characteristic-related histories.

Within groupings the dynamic modification history is sorted by date and time of the first completion of inspection requirements.

The dynamic modification history is grouped and shown in tabular form. Groupings by the OP sequence number of the inspection step characteristic are not performed for batch-related dynamic modification history.

Utilization

This application has been designed to verify the entire dynamic modification and to present the respectively determined inspection severity and the inspection result as basis of dynamic modification. In addition, the current inspection severity may be corrected.

Prerequisite

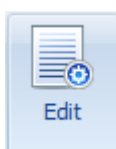

The dynamic modification history only considers completed inspection requirements that have been modified dynamically based on batches and for which the first completion date, the first completion time as well as the usage decision are assigned.

Selection criteria

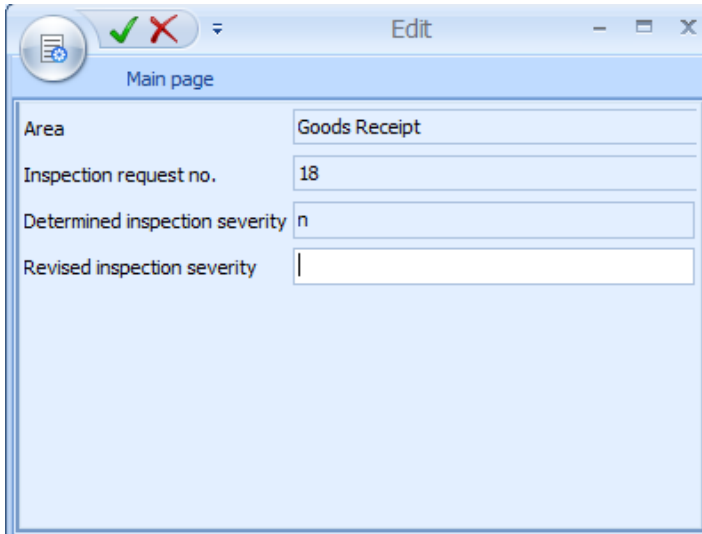

Selection criteria are self-explanatory and not described separately.

Toolbar

Edit

The determined inspection severity may still be corrected by using the "edit" function.

Area	Goods Receipt
