

1 Payment rules

Overview

Menu	Human resources management → Models → Payment day types → Payment rules
Transaction code	paru
Function authorization	paru

You request the payment rules in the toolbar [Payment day types](#). The payment rules specify which parts of the working time are offset against which wage type.

Selection criteria

The application provides the following selection criteria:

Day type, valid from

The number and the validity start date of the payment day type are transferred when the payment rules are called. [Payment day types](#). If both fields are empty, the payment rules for all payment day types are displayed and you can check which wage types are used for which payment day types.

Editing functions

The following dialog opens to edit a data record:

The screenshot shows the 'Edit' dialog box for payment rules. The dialog has a title bar 'Edit' with standard window controls. It contains several sections:

- Payment day type**: 'Day type' is set to 200, and 'Valid from' is set to 1/1/1900.
- Payment rule**: There are two tabs, 'Validity' and 'Last editing'.
- Wage type**: 'Wage type' is set to 300, and 'Night Extra 25%' is selected.
- Processing**: A list of radio buttons for different processing methods. 'Fixed time' is selected. Other options include: Until reaching target time, Overtime, Working time, Compensation time, Core time violation, Working time before beginning of skeleton time, Working time after end of skeleton time, Paid break, On-call duty, and Stand-by duty.
- from**: 20:00, **to**: 6:00.
- Commentary**: A text field for additional comments.
- Settings**:
 - ☐ Authorization required
 - ☐ Set off against overtime type
 - ☐ Hide
 - Time type**: ☒ Either, ☐ Target time, ☐ Overtime

The availability and significance of individual fields depends on the selection of the processing of the payment rules. This is why you will find a description of the available fields and a description of how the individual types work below. We will also touch upon fields, which are not always available.

Field description for the tab "Payment rule"

Wage type

Wage type that is to be generated by the rule.

Processing

Processing of the payment rule (until target time is reached, overtime, working time, catch-up time, fixed time, core time violation, working time before general start, working time after general end, paid break, on-call duty). Payment rules are described in the next chapter.

Comment

You can enter in this field a comment on the payment rules.

Authorization required

If this field is activated, the wage type postings resulting from this payment rule require approval and must be signed or rejected in the application. [Labor time maintenance](#)

Calculate overtime type

Posting of daily overtime is not directly to the wage type, but is done via the overtime type.

Do not post

If the time should not be posted, then the time of the specified wage type is not generated.

Hide

You can specify if this rule should hide other rules for target times or overtime.

Time type

You can use this button to specify if the rules is only for working times during the target time or overtime or both. Example: You can specify that late bonuses are no longer paid, if an overtime bonus is already being paid, or that the night bonus is greater for overtime than during the general working hours (target time).

Field description of the validity tab

Payment day type

Day type 200 ... 3-Shift Mo-Fr Valid from 1/1/1900

Payment rule **Validity** Last editing

Day of validity

- ☒ Monday
- ☒ Tuesday
- ☒ Wednesday
- ☒ Thursday
- ☒ Friday
- ☒ Saturday
- ☒ Sunday
- ☒ Public holiday
- ☒ Important public holiday
- ☒ Other day off

Shift type

Shift type

Previous day and next day

- ☐ Process payment rule also on the previous day
- ☐ Process payment rule also on the next day

These field are only available for payment day type - day type or for absence payment.

Day of validity

The payment rule valid for weekday or public holiday type.

Shift type

Restriction of the payment rule for a certain shift type. The entry * (asterisk) stands for all shift types.

Process payment rule on the previous day

The field is only valid for payment rules of the type "Fixed time from ... to ..." and controls whether the payment rule is also valid on the previous day. For example: If a night shift begins on the day before a public holiday and is assigned to the previous day for accounting purposes, you can use this button to calculate the public holiday bonus without having to create your own payment day type for the day before the public holiday.

To additionally process payment rules on the next day

The field is only valid for payment rules of the type "Fixed time from ... to ..." and controls whether the payment rule is also valid on the next day. For example: If a night shift begins on a public holiday and is assigned to the following day for accounting purposes, you can use this button to calculate the public holiday bonus without having to create your own payment day type for the day after the public holiday.

The planned payment day type of the previous and next days is processed for the two buttons "Process payment rule on previous day" and "Process payment rule on next day". This is independent of which payment day category is actually used on the previous and next day due to manual editing or shift type payments.

Payment rules

Up to the target time being reached

This payment rule says that, until the planned working time has been reached, the employee's working time should be posted with the specified wage type.

Undertime

If the payment day type is used as overtime type, then you can see on top the processing of "Undertime". This processing determines that the total undertime in a period for the overtime calculation is offset against the specified wage type on the 1st day of the period. Undertime is the time a person lacks to reach the target time within a calculated period. Example: A weekly planned working time of 40 hours and an actual working time of 37.5 hours results in 2.5 hours of undertime, which is posted to a wage type using this payment rule.

Overtime from ...

This is used to post overtime. It can be specified here, after what duration, overtime should be posted with the specified wage type. Example: You can specify that the first two hours of overtime are posted with a 25% bonus, between two and five hours overtime with 50% bonus and after five hours no overtime is posted at all. In this payment rule, you can choose in the lower part of the window whether the time is not to be posted (that is, it is discarded, the specified wage type is not created) or whether the overtime is to be calculated using the overtime category for payment day types. In this case, the basis of the allocation of overtime is the overtime type specified in the HR master data, in which the rules for the allocation of overtime and undertime can be found. The wage type for the planned time must be specified as the wage type for the target time, so that for overtime compensation of more than one day, the wage type ensures that undertime on one day is compensated with overtime on another day.

Working time from ...

This processing is similar to the processing of "Overtime from", but the period to be entered refers to the total working time. You can only use this payment rule to offset times once the target time has been completed. If a time is entered, which is smaller than the target time, then this rule only applies once the target time has been reached.

Fixed times from ... to

You can use this payment rule to specify the wage type for a specific period of time of the day. Late and night shift bonuses can be posted in this way. Times that extend past midnight must be added to 24:00 hours (example: a booking of 23:00 to 2:00 = fixed time from 23:00 to 26:00). You can also select at the bottom of the window, whether this rule should hide other rules for target time or overtime.

In the bottom line, you can also specify whether the rule should relate to the period of **the target time, the overtime** or **both**. Example: You can specify that late bonuses are no longer paid, if an overtime bonus has been paid, or that the night bonus is greater for performed overtime than during the general working hours (target time).

Night surcharges are configured separately for the early shift and night shift:

While for the night shift, you can store a rule from 8h to 30h, you must create a rule from 0h to 6h for the early shift if someone has started during the time when a night surcharge is to be posted.

Compensation time to ...

Using this payment rule, you can post compensation time, which is mainly required in Switzerland. This means, that the first 15 minutes of working time can be credited to a working time account every day. Only after these 15 minutes, the working time is counted as part of the target time. When this type is used you should note that the compensation to be posted may not be greater than the target time from the working time day type and that at least one payment rule "Until target time reached" must exist.

Core time violation

A rule of this type has the effect that the core time violations of an employee are posted to the specified wage type.

You only use the rule for the "Core time violation" to calculate labor time. If several rules of this type exist, the rule for core time violations is used, for which the smallest wage type is calculated.

Working time before skeleton time start, working time after skeleton start

These rules have the effect that, for flextime workers or flexible shift workers, the working time outside the skeleton time is posted to the specified wage type. Use the **Hide** button to specify whether time posted in this way counts as working time or if it is hidden when the working time is calculated.

Paid break

With this payment rule, the duration of a paid break which is specified in the working time day type can be posted to a wage type.

On-call duty, stand-by duty

Both payment rules are only available if you have a license for an additional function [On-call duty](#).
