

1 Labor Time Maintenance

Overview

Menu	Human resources management → Maintenance → Labor time maintenance
Transaction code	ptma
Function authorization	ptma clk (detail application <i>Clockings</i>) wtbo (detail application <i>Wage type postings</i>) subsen (detail applications <i>Labor time comparison</i> and <i>Personnel postings</i>)

Using the *Labor time maintenance* function, you can display, change, complement and delete the clocking records and the respective postings of selected persons for a specified period. You can use this function to react in the short term to unplanned or unique events during operation. The function also provides quick information because it displays the clockings and the relevant wage type postings with messages, labor time comparison and personnel postings.

The screenshot displays the SAP Labor time maintenance (PTMA) interface. The top bar includes navigation icons for Request data, Cancel, Print preview, Print all, Insert, Copy, Edit, Delete, Authorize, and Reject. The main area is divided into several sections:

- Selection:** Fields for Person from (96665), to, Name (Hanson, Betty), Company, Area, Cost center, Date from (1/01/2018), to (28/02/2018), and a checkbox for Compress wage type postings.
- Clockings:** A table with columns: Staff (Person, Name), Weekday, Date, Beginning, End, Type, Duration, Day type, Designation, Status, Authorization, Modified by, and Modified on. The table shows data for Hanson, Betty from 1/01/2018 to 9/01/2018, including Absence, Attendance, and Unplanned absent records.
- Wage type postings:** A table with columns: Date, Time, To, Wage..., Designation, Dur..., Authorization, Modified by, and Modified on. It shows a posting for 1/01/2018 at 8:00 for a 600 wage type.
- Messages:** A table with columns: Date and Message. It shows a message for 1/01/2018: "Absence 600 'Holiday' has been allocated".
- Personnel postings:** A table with columns: Time t..., Login, Login time, Logoff time, Workplace, Labor utilization, and MES order number.

In the Labor time maintenance, the [columns of the time sheets](#) can be shown. Each column shows a wage type and the relevant wage type postings. Using the columns, you can compare the wage type postings for specific persons over a longer period of time.

This function is only available if the extension [PersonalTimeMaintenanceShowWageTypes](#) is activated.

Field descriptions of the *Clockings* table

Clocking

Type

Clocking type; possible entries are *Present*, *Clock-in*, *Clock-out*, *Business trip*, *Absence* and *Unplanned absent*.

Date

Date of clocking

Beginning, End

Time of clocking recorded by the employee on the terminal.

CEST

Central European Summer Time (CEST): This option specifies whether the time is in winter time (option not set) or summer time (option set).

Rounded times: Time, to

These fields include the clocking times rounded by the labor time calculation. You can use these fields to correct the rounding manually. If these two fields are populated, the rounded times are not recalculated by the labor time calculation. If a new rounding of the labor time calculation is required, the two fields must be left empty.

If you create a clocking for a day that already has an existing clocking, the rounded times of the existing clocking are deleted if it is an original clocking. Advantage: If a rounding of the actual working time or different rounding rules within the working time are defined, a new rounding is performed for the existing clocking.

Duration

The *Duration* column includes the duration of the rounded clockings minus breaks. The entry in this column is only available once the clockings have been evaluated.

Attendance time

The column Attendance time shows the sum total of the times of all attendance and business trip clockings for the respective day. If several clockings are available for a day, the attendance time is only entered in the first row of the day.

Settlement date

Date on which this clocking record is settled. Clocking date and settlement date can be different. The employee can work until after midnight or start work before midnight and the night shift is allocated to the next day.

Day types**Working time day type**

Working time day type that is used on this day. All clockings of a day are evaluated using the same working time day type. If you change the working time day type or the shift type in a clocking, this change affects all clockings of the settlement date. If you delete the working time day type **and** the shift type that can be entered for shift workers, the day type, which was planned for this day, is used in the next evaluation.

Shift type

Shift type of the shift day type or flexible shift day type. For employees who work according to a flextime day type, this field remains empty.

Payment day type

Specifies the payment day type used to settle this clocking record. To identify the payment day type, the labor time calculation reads the payment day type in the payment model or in another planning (e.g. in the absence planning or personal models or day types) and enters it here. If you enter a different payment day type, the clocking record is calculated according to this rule. If you delete the payment day type entered, the day type planned for this day is used in the next labor time calculation.

Cost center

Cost center the clocking record is assigned to. If this field is empty, the master cost center of the employee is entered for the work day evaluation. If an employee has worked for a different cost center, you can manually overwrite this field.

This field is only available if the cost center posting license is activated (PZW-KSB).

Recorded cost center

If a cost center has been recorded with the clocking in the terminal, this cost center is shown in this field.

This field is only available if the cost center posting license is activated (PZW-KSB).

Comment

You can enter a comment in this field. For example, it is possible to document why a clocking record has been edited.

Abbreviation

Abbreviation from the [Control of absences](#) that is also displayed in the calendar of the [Personnel Scheduling](#) for an absence. For unplanned absences, "UNG" is entered in this field.

Status

The following types are available:

Original: the clocking record is in the original state, as it was created by the employee.

Edited: the clocking record was modified by user.

Automatically: the clocking record was created by the system, because the employee was absent.

Authorization, Modified by, Modified on

In case of original clockings of the employee, these fields are empty. Clockings that require an approval are identified via *Processing required*. If the clocking record has been edited, rejected or approved, the respective status is entered including person and time of modification. For approved clockings, the authorization is displayed in green. If the clocking has been rejected, the authorization is displayed in red.

The days and the clockings included in the table *Clockings* are sorted by personnel number, date and start date of the clocking. You cannot change the sorting of this table.

Editing functions

Insert, edit, copy and delete clockings

Double-click a clocking to open an editing dialog. If you double-click a day without clocking, a dialog opens to create a clocking.

If you have changed the clockings of a day, you can manually start the [labor time calculation](#) to recalculate the changed clockings. The results are directly displayed when the labor time calculation is finished. If you do not start the labor time calculation manually, the changed clockings are recalculated during the next run of the labor time calculation that is automatically started at specified times.

Changes of original clockings are logged in the [Clockings](#) and can be traced here. The list also includes deleted original clockings.

Authorize and Reject clockings and wage type postings

The authorization of clockings and wage type postings is the explicit approval of specific postings for wage types. These could, for example, be bonus or overtime postings.

Messages for postings that require authorization are displayed in blue in the messages listing. You can edit the messages similar to errors occurred if you double-click the message in the window *Labor time maintenance*. If all postings of a day that require authorization have been processed, then the relevant message disappears from the messages listing.

Rejected postings are not included in the monthly result or when the wage types are transferred to the payroll accounting system.

The following options are provided to configure that an authorization is required:

In the definition of the [Wage types](#)

Result: All postings for the specified wage type require authorization and are identified as such.

In the different payment rules of the [Payment day type](#)

Result: Exactly this posting requires authorization. This is useful to control the posting of overtime and bonuses.

When unplanned absence records are created

In the [Control of labor time calculation](#), you can specify whether absences require authorization that have not been defined in the absence planning.

In absence planning

In the [Absence planning](#), you can configure that the resulting absence record and the relevant postings require authorization.

In the definition of absence reasons

You can specify here if the [Absence reasons](#) require authorization that the employee has entered on the terminal (e.g. doctor's appointment).

If a clocking is approved, the authorization requirement of the resulting wage type posting is automatically reset. You can use the option *Sign manually created and changed clockings automatically* in the PZE tab of the [Basic settings](#) to configure if wage type postings, which result from manually created or changed clockings, require authorization or not.

Toolbar

Authorize

Clocking (function authorization clk.sign): A clocking that requires authorization is approved. If you authorize a clocking, the authorization requirement of all related wage type postings is automatically removed.

Wage type posting (function authorization wtbo.sign): The selected posting is authorized. If, on one day, one or more authorized or rejected postings are available, then none of the wage type postings of this day is changed by the work day evaluation.

Reject

Clocking (function authorization clk.reject): A clocking that requires authorization is rejected. If a clocking is rejected, all related wage type postings that are neither approved nor rejected, are deleted.

Wage type posting (function authorization wtbo.reject): The selected posting is rejected.

Labor time calculation

Starts the [labor time calculation](#) for the day selected in the list of clockings. If you immediately require the result of the correction, you can use this button to manually call the work day evaluation. If this is not necessary, the system performs the evaluation at a later time.

You can control the authorization to call the *Labor time calculation* in the *Labor time maintenance* via several function authorizations:

ptma.view: The user can start the *Labor time maintenance*, but is not authorized to call the *Labor time calculation*.

ptma or **ptma.evaluate**: The user can start the *Labor time calculation* only in the *Labor time maintenance* and therefore only for one person.

ptev: The user can call the *Labor time calculation* in the *Labor time maintenance* for one person and also via the menu and therefore for several persons.

Messages listing

Opens the [Messages listing](#) for the selected period of time.

Working time information

Displays the [Working time information](#) for the selected employee and for the day selected in the list of clockings.

Time sheet

Displays the time sheet for the current month.

Personnel Scheduling

Calls the [Personnel Scheduling](#) for the selected person.

Personal working time

Calls the [Personal working time](#) of the selected person.

Personal day types

Calls the [Personal day types](#) of the selected person.

This function is only available if the extension [PersonalDayTypesInPersonalTimeMaintenance](#) is activated.

Current account balances

Displays the [current account balances](#) current account balances of the selected person.

Reset labor time calculation

Via the [Reset labor time calculation](#), you can reset the results of the labor time calculation.

Detail applications

Wage type postings

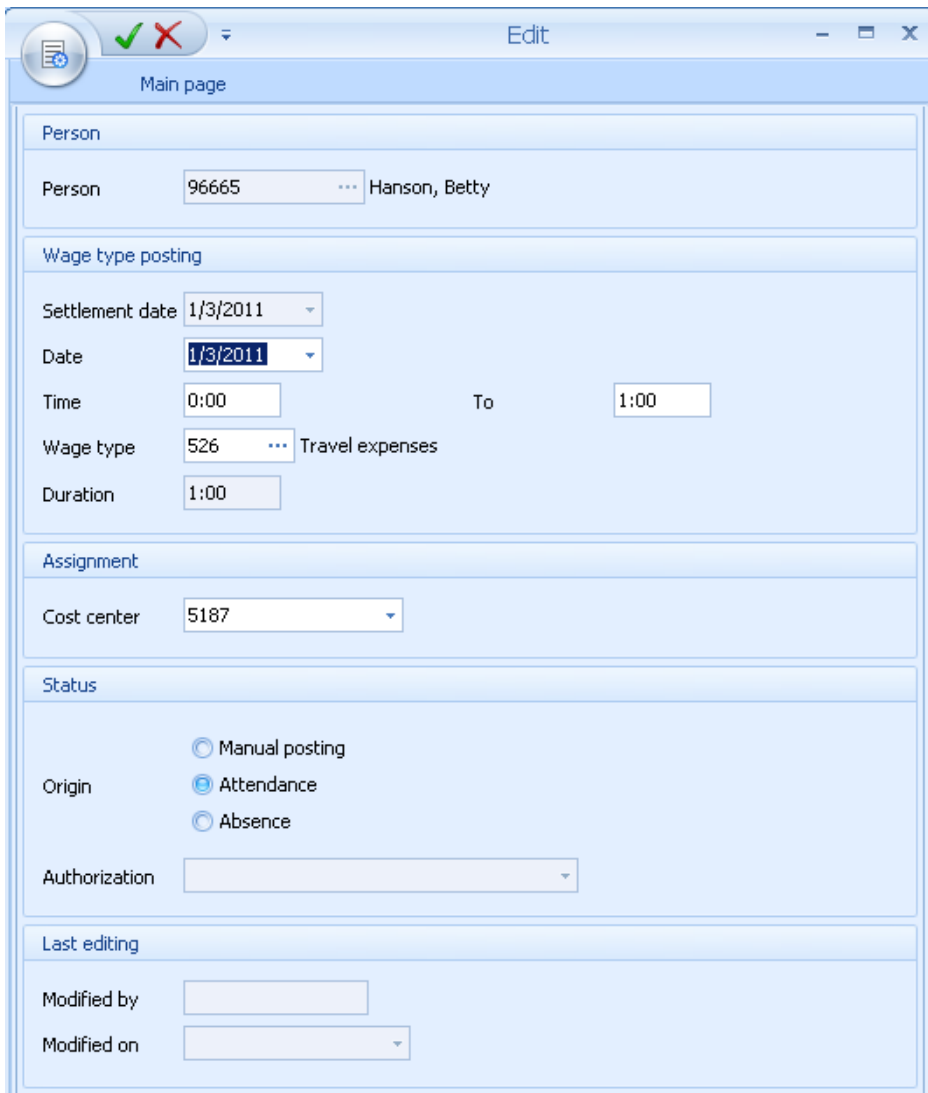

Wage type postings are created during the labor time calculation. The wage type postings are based on the employees' clockings and the payment rules of the assigned payment day type. Similar to clockings, the wage type postings can be created or edited.

If the selection criterion *Compress wage type postings* is enabled, the wage type postings are totaled for each *Wage type*, *Cost center*, *Modified by* and *Authorization*. This view provides a quick overview of the time posted for each wage type. If the selection criterion *Compress wage type postings* is not enabled, the separate wage type postings for *Wage type*, *Cost center*, *Modified by* and *Authorization* are displayed. With this view, you can identify the separate periods where the wage type was posted and the breaks used to calculate the labor time.

If the selection criterion *Compress wage type postings* is enabled, the function key to edit wage type postings is only active if the selected entry in the table of the wage type postings only includes one wage type posting. If a combination of several wage type postings is selected, you can only edit the different wage type postings if the selection criterion *Compress wage type*

postings is disabled.

Person

Person 96665 ... Hanson, Betty

Wage type posting

Settlement date 1/3/2011

Date 1/3/2011

Time 0:00 To 1:00

Wage type 526 ... Travel expenses

Duration 1:00

Assignment

Cost center 5187

Status

Origin ☐ Manual posting ☒ Attendance ☐ Absence

Authorization

Last editing

Modified by

Modified on

If an attendance or absence time is changed, authorized or rejected, all postings of this evaluation day are not changed any more by the labor time calculation. Result: If you have made a change, this change is not overwritten if you edit the relevant clocking record. If you want to undo the changes, you can delete the wage type postings and start the labor time calculation.

Postings of type *Manual* are times that are booked additionally to the wage types identified by the labor time calculation. Manual postings are not changed by the labor time calculation. The manual postings also do not prevent other postings of the day from being recalculated by the labor time calculation. Manual postings are included in the monthly total and are therefore forwarded to the payroll accounting system if an automatic interface is being used. If it is a wage type that is kept in an account, the account is offset. It is therefore recommended to make manual wage type postings to correct individual time accounts.

Only use the option to directly change postings of attendance or absence times if the required result cannot be obtained via configuration.

Field descriptions

Settlement date

Date of posting

Time, To

Start and end time of posting

Wage type

Wage type of the posting

Duration

Posting duration

Cost center

Assigned cost center of this posting. The clocking specifies the cost center. If you manually create wage type postings, this field is preset with the person's master cost center and can be changed if necessary.

The field *Cost center* is only available if the license of cost center posting is activated (PZW-KSB).

Origin

The posting has been created due to an attendance or an absence or has been created as a manual posting.

Authorization, Modified by, Modified on

These fields show the postings that require authorization and the persons that authorized or rejected the posting. The column Authorization is displayed in different colors:

Yellow: Postings that require authorization

Green: Edited or authorized posting

Red: Rejected posting

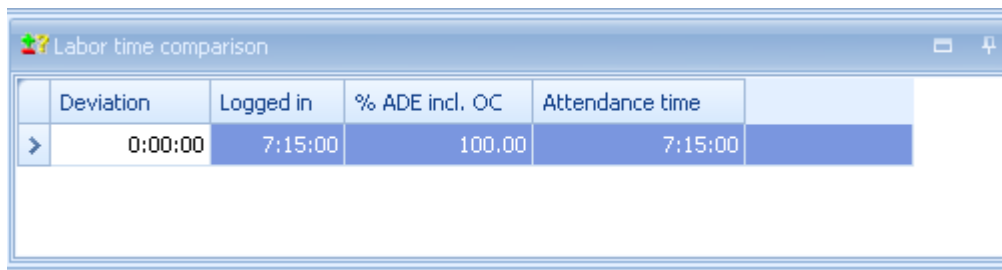

Messages

This detail application displays errors and special incidents that occurred during labor time calculation. You can configure in the [Configuration of messages listings](#) using the messages listing 999 which messages are displayed. For information on the meaning of the different messages, refer to the documentation [Process of labor time calculation](#).

Labor time comparison

The detail application is only displayed if the function *Subsequent entry of PZE/BDE postings* is available and if the user has the function authorization.

Function authorization	subsen
------------------------	--------

Deviation	Logged in	% ADE incl. OC	Attendance time
0:00:00	7:15:00	100.00	7:15:00

The Labor time comparison compares the attendance time calculated in the Personnel Time Management and the person-related times of the order data collection. The detail application *Labor time comparison* displays the personal day selected in the clockings' list. If no attendance time and no time of the order data collection is available for this person on this day, then no data record is displayed.

You use this detail application in combination with the detail application *Personnel postings* described below as source of information to subsequently enter order-related personal postings.

Field descriptions (the most important fields)

Deviation

Difference between attendance time (HYDRA-PZW) and posted time and labor data (HYDRA-BDE). A possible reason for the difference can be the assignment of BDE postings to PZW days described below.

Differences, which do not exceed one minute, are not highlighted in color.

Differences between one and five minutes are highlighted in yellow.

Differences exceeding five minutes are highlighted in red.

Logged in

All personal times that have been posted as BDE personal postings (B records) for operations on the selected day.

%BDE incl. OC

Ratio of labor time posted (BDE) to attendance time (PZW) in percent.

Attendance time

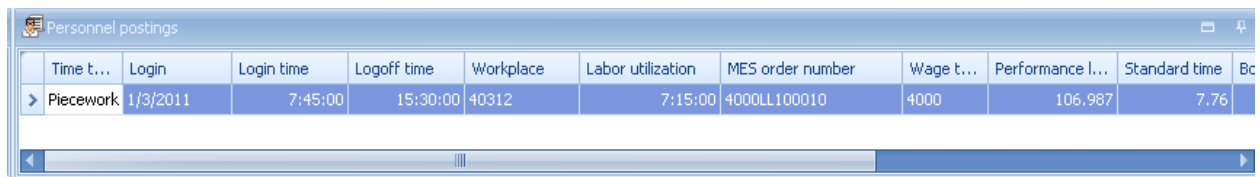

Attendance time from Personnel Time Management (HYDRA-PZW). This time has already been rounded or cut according to the evaluation parameters that are applicable in HYDRA-PZW.

For detailed information and a description of the possible options, refer to the documentation [Labor time comparison](#).

Personnel postings

The detail application is only displayed if the function *Subsequent entry of PZE/BDE postings* is available and if the user has the function authorization.

Function authorization	subsen
------------------------	--------

Time t...	Login	Login time	Logoff time	Workplace	Labor utilization	MES order number	Wage t...	Performance l...	Standard time	Bc
Piecework	1/3/2011	7:45:00	15:30:00	40312	7:15:00	4000LL100010	4000	106.987	7.76	

The detail application *Personnel postings* displays the BDE personal postings and the bonuses of persons. The detail application lists the expected results of the wage calculation. This list is identical to the independent application *Record listing*. The detail application *Labor time comparison* displays the personal day selected in the clockings' list.

The columns are described in the documentation of the [Record listing](#).

In the detail application *Personnel postings*, you can use the editing functions of the group *Subsequent entry* in the toolbar to edit, create and delete the BDE personal postings. The editing dialog that opens is simplified.

Sequence
Split

When you insert a BDE personal posting, the fields including the personnel number, the times, the resource performance account 11 "MUT", the login and logoff times and the shift information are populated using the information from the detail application *Labor time comparison*. Condition: The attendance time issued by the Personnel Time Management (PZW) is greater than the sum total of the BDE personal postings already recorded.

The editing function is a simplified version of the BDE personal postings. The fields are described in the documentation of the [Record listing](#) and the standard editing functions are described here: [BDE personnel postings](#).

The simplified editing function facilitates the manual subsequent entry of BDE personnel postings. The simplified editing function also permits a separate customization that does not include the full editing functions. It is therefore easier to make changes according to the customer's requirements.

With users that are not interested in the *Labor time comparison* and the *Personnel postings*, you can deactivate the function authorization *subsen* to improve the performance of the *Labor*

time maintenance.
