

1 Overview of Workforce Requirements

Summary

Menu	Human resource management → Personnel scheduling → Overview of workforce requirements
Transaction code	perov
Function authorization	perov

The overview of workforce requirements shows the requirements for people based on the planning in HLS. If operations are planned on a machine for which workforce requirements are configured, they are displayed as workforce requirements.

<Screenshot>

Usage

Qualifications

The planned operations are displayed per workplace. The bar layout is a result of the calculated runtime or remaining run time of the operations. The requirements for people result from the configuration of the requirements at the workplace. The available people who have the required qualification are listed with respect to the requirements.

Histogram

Color assignment for the histogram representation:

Bedarf nicht gedeckt	
Bedarf gedeckt	
Bedarfsüberdeckung	

Selection criteria

The following selection criteria are available in the application:

Qualification

The determination of the requirements can be limited to certain qualifications.

Planning profile

The determination of the workforce requirements can be limited using a planning profile. This field can only be accessed if the additional function Advanced selection and visualization (PEP-ESV) is present.

Period

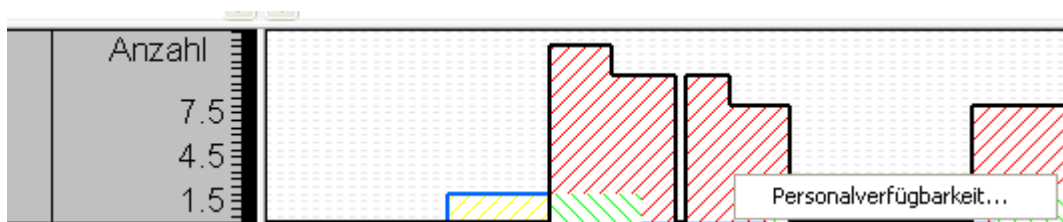

Period for which the workforce requirements are to be determined.

By selecting a qualification, the coverage of the workforce requirements for individual qualifications can be displayed. Because multiple qualifications can be assigned to one employee, it is also required to check the workforce requirements without limiting the qualification in order to list the number of available employees with respect to the workforce requirements without taking the qualifications into consideration.

Detail applications

The right mouse button can be used to call the Workforce availability window in the histogram. The position of the mouse specifies the point in time for which workforce availability is to be displayed.

In the *Workforce availability* window the people who are available and those who are unavailable at the specified point in time are listed:
