

1 Personnel shift log

Overview

Menu	Order management → Production reports → Personnel shift log
Transaction code	pspr
Function authorization	pspr

Purpose

The personnel shift log is an absolute necessity for anyone in a position of responsibility in production. Here, the shift supervisor, the shift manager and the foreman are each provided a clear overview of all of the important information needed relating to their staff.

The personnel shift log is a function in production management. This function makes it possible to create shift-related reports about the produced orders by person. With the additional graphic presentations showing quantities and durations, the user is given an excellent overview of all data concerning personnel.

This function provides the information about the operations completed during a shift. In addition to the quantities produced, the log also shows the times needed. This is shown for each person logged on at the operation.

Integration

Shown in the personnel shift log are all operations that were selected in the selection panel. Here, only BDE log records of record type "B" are considered.

When requesting the data, the system checks

- the person's area of responsibility when selecting by cost center
- the responsibility area of the workplace when selecting by workplace or group
- the responsibility of the workplace when selecting by report group
- the person's responsibility area when selecting by employee group.

It is possible to correct the entered personnel postings in the [Order-related postings](#) function.

Requirements

In order to use the personnel shift log, what is required is that personnel-related postings are performed and that the relevant, finished postings (log records) exist in the system.

Selection criteria

The application provides the following selection criteria:

Date from ... to ...

Enter a period of time to narrow down the displayed log records. The system selects the log records with a start date (logon date) in the period defined.

The preset value is "Today minus 7 days" to "Today". The date is calculated based on the Gregorian calendar.

Shift all, 1, 2, 3, 4

Within the entered period, only those log records are selected that are assigned to the shift entered according to the shift model.

At the time the data is selected, the system does not include operations that were logged on during the currently running shift, because no log records have been generated for them yet.

Workplace from ... to ...

Selects the log records posted to the *workplace* that was entered, the responsibility area of which the user has authorized rights to. You can also run a search using wildcards in the field.

Group from ... to ...

Selects the log records posted to the *workplaces*, the responsibility area of which the user has authorized rights to, and that are assigned to the entered group. You can also run a search using wildcards in the field.

Cost center

Selects the log records posted to the *staff*, the responsibility area of which the user has authorized rights to and that are assigned to the entered cost center.

Additional notes on the selection

Long-term data

If the selection period exceeds the period of time of the online data area, the system implicitly selects the data of the medium-term data area. You need not explicitly activate the access to the medium-term data area.

Personnel shift log detail application

The detail application provides the following fields:

Category Shift**Shift date**

Shift date of the shift in which the operation is completed.

Shift

Shift in which the operation is completed.

Person category**Person**

Personnel number of the person logged on at the operation.

Last name

Last name of the person logged on at the operation.

First name

First name of the person logged on at the operation.

Name

Entire name of the person (last name, middle name and first name) who was logged on at the operation.

Operator position, designation, description

Operator position that was used when the person logged onto the workplace (depending on how the system is configured).

Order category**Category**

Order category for the order/ operation, e.g. production order (FA) or overhead cost order (GK).

Order type

Order type of the order

Order

Order number of the order/ operation.

Sequence

Sequence number for the operation (depending on how the system is customized/ configured).

Operation

Operation number for the operation

Split

Split number of the operation, if the operation is a split operation (depending on how the system is customized/ configured).

Article/article designation

Article number and article designation of the operation.

Workplace category**Workplace/group/cost center**

In addition to the order and article number, the workplace is displayed (including group and cost center of the workplace) where the operation has been produced in the selected shift.

Primary quantities category**Target quantity**

The operation's target quantity in each of the quantity units (primary quantity unit, secondary quantity unit, tertiary quantity unit, base quantity unit).

For this column, no total is calculated. In some cases, one operation is produced during several shifts and here it is not correct to calculate totals.

Yield

The yield posted for this operation in relationship to the selected shift.

Scrap

The scrap posted for this operation in relationship to the selected shift.

Rework

The rework quantity posted for this operation in relationship to the selected shift.

Open quantity

The open quantity posted for this operation in relationship to the selected shift.

Quantity unit

The relevant unit of quantity.

Duration category**Target duration**

The target duration relating to the operation is edited as follows:

$$((\text{Operation's target cycle [per 1000]}) / 1000 / \text{the operation's partitioning} * \text{operation's target quantity in primary quantity unit}) + \text{operation's setup time}$$

For this column, no total is calculated. In some cases, one operation is produced during several shifts and here it is not correct to calculate totals.

Production

The production time entered for this person at the operation in relationship to the selected shift.

Downtime

The downtime entered for this person at the operation in relationship to the selected shift.

Sum (total)

Total of all production times and downtimes (sum of columns Production + Downtime).

RPA category**RPA**

Detailed presentation of the actual times entered at the resource performance accounts level.

Note**Displaying the actual quantities and the actual durations (RPA)**

The shift automatic option is not available for workplaces that are not assigned to any terminal or that are assigned to a terminal configured as a BDE terminal (shop floor data collection). This means that there are no automatic order or person-related postings at the end of shifts. In this case, you cannot exactly assign the recorded quantities and durations to the shifts. The system therefore assigns quantities and durations proportionally. This assignment is based on the workplace's shift calendar.

Example:

In the example, the shift model is as follows: shift 1: 6:00 am to 2:00 pm; and shift 2: 2:00 pm to 10:00 pm. This shift model is assigned to a workplace that is in accordance with the criteria listed above. An OP has been logged on at 1:00 pm and off at 4:00 pm. For the OP logoff, 90 is uploaded as the yield.

In this case, the shift log for the operation in shift 1 will calculate an order duration of 60 minutes and a yield of 30. For shift 2, an order duration of 120 minutes is calculated and a yield of 60. The RPA-related durations are also calculated based on the shift model that the workplace is based on.

Display of the personnel time in the personnel shift log

In the personnel shift log, the identifier "Post production to main utilization during break" from the HYDRA basic settings is NOT taken into account. This means that the labor duration posted to main utilization (RPA 11) during breaks is removed from the postings the calculation is based on (record type "B").

For example: the calculation is based on a shift model from 6.00 am - 2.00 pm with a break between 12.00 noon and 1.00 pm. The status Production is in effect from 6.00 am to 12.30 pm and from 1.00 pm to 2.00 pm.

7.30 hours will be posted as main utilization time for a person logged on from 6.00 am - 2.00 pm (assumption: no multiple machine operation) - if the identifier "Post production to main utilization during break" is set. When the personnel shift log is called up, this time is compared to the shift calendar so that a main utilization time of 7.00 hours is calculated for the shift model provided above.

Durations acc. to person detail application

Shown in the "Durations acc. to person" detail application are the durations posted to each person. Considered here are the operations that were selected in the personnel shift log detail application.

The bar chart shows the person (personnel number) for the selected operations on the Y axis and the absolute values (durations) on the X axis. The respective quantity accounts specify the color of the bars (production/RPA 11: green; downtimes/RPA 1-11: red). Bars are sorted in descending order by production duration.

You can use a multi-combo box to define the durations that are shown as a bar:

- Production
- Downtimes

The bars are shown in a "stacked" form so that the total quantity can be defined differently for each user.

Activate the check box "Show labels", to show the values on the bars. Note: These labels are displayed for the selected duration.

Quantities acc. to person detail application

Shown in the "Quantities acc. to person" detail application are the cumulated quantities (primary quantity unit) posted to each person. Considered here are the operations that were selected in the personnel shift log detail application.

The bar chart shows the person for the selected operations on the Y axis and the posted quantities on the X axis. The bar colors are based on each quantity account (yield: green; scrap: red, rework: blue, open quantity: gray). Bars are sorted in descending order by yield.

You can define for which quantity accounts (primary quantity unit) you would like to show bars from a multi-combo box:

- Yield
- Scrap
- Rework
- Open quantity

The bars are shown in a "stacked" form so that the total quantity can be defined differently for each user.

Activate the check box "Show labels", to show the values on the bars. What needs to be considered is that these labels are displayed for each selected quantity account.

Toolbar

When you call a function or target application, the parameters of the table are always transferred. For this reason, always select an entry to call an application.

**Order information**

Use this button to call the application [Order information](#).

**Order overview**

Use this button to call the application [Order overview](#).
