

1 Workplace Assignment

Overview

HYDRA menu	Production control → Workforce requirements planning → Workplace assignment Human resources management → Workforce requirements planning → Workplace assignment
FEDRA menu	Advanced resource planning → Planning → Workplace assignment
Transaction code	wpas
Function authorization	wpas

Staff can be planned on workplaces using the workplace *Assignment function*. Planning can be performed manually as well as automatically.

Display

The center of the application shows the workplaces including the required qualifications grouped by workplace groups. The workforce requirements for the relevant qualification are shown in the bar for each shift. The bar length depends on the planned year model or on the year model of the [workplace](#). Only the workplaces for required workforce are displayed.

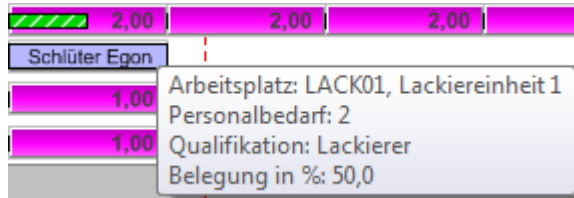

The "workplace assignment" does not allow for the breaks resulting from the employees' planned working time and that of workplaces. Instead, the workplace assignment plans entire shifts so employees and workplaces have continuous bars.

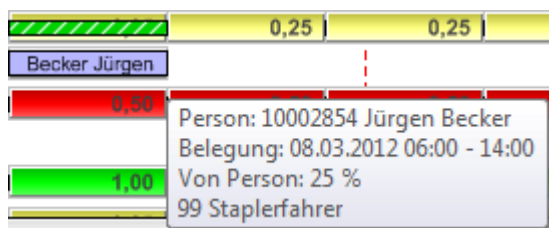

The format of the date values displayed on the Gantt chart depends on the format specified by the operating system. The client format is not relevant.

The lower section of the workplace assignment shows the available staff grouped by areas and the unavailable staff grouped by the abbreviations for absence reasons. The bar length depends on the standard working times (beginning of normal time and end of normal time) from the planned working time day type.

A green hatched bar shows the assignment rate in percent per shift at a workplace. The shift tooltip shows the percentage rate as figure. In addition, the planned staff is displayed:

The tooltip of an assigned person provides information about the person, their qualifications and assignment:

There are different ways of presenting for the assigned staff:

Presentation	Description
	The employee provides the required qualification
	The employee does not provide the required qualification

Weis, Sabine	Assigning the employee exceeds the workforce requirements for the workplace
--------------	---

Requirements

If you want to show the planned personnel capacities, you have to make sure that the absence and shift planning are maintained properly in HYDRA. You can do this in the [Personnel scheduling](#) application.

You also have to define personnel requirements. You can do this in three different ways:

- [Workforce requirements for workplaces](#)
- Workforce requirements defined by the machine/operator relation (M/O relation for setup, M/O relation for production) of [operations](#)
- Workforce requirements defined by the [production resources and tools](#) (resource types *PRU* for setup and *PER* for production)

You must plan operations in detail if the planned operations should be included in the workplace assignment. You can do this, for example, in "graphic planning". As an alternative, the ERP system might already have planned the operations in detail to send them to HYDRA.

Please note that "workplace assignment" and "graphic planning" should not be used simultaneously in production preparation. Inconsistencies might occur if personnel and capacities are planned at the same time, as the "workplace assignment" uses planning data of "graphic planning".

Selection criteria

The user selects personalized data. The application provides the following criteria for the user to select:

Qualification

The personnel requirements to be displayed and the available persons can be restricted to specific qualifications. This field does not act as a selection criterion when you request data, but filters the qualifications in the data displayed. This allows different views of the currently displayed planning without having to save the information and request the data again.

Planning profile

Using the planning profile, personnel assignment can be restricted to specific workplace groups and employees.

This field is only available if the additional function "enhanced selection and visualization" (PEP-ESV) is available (only applicable if HYDRA is used).

Toolbar

**Zoom in,****Zoom out**

These buttons reduce or increase the displayed workplaces and employees.

Hide complete assignments

Using this button, you can hide fully occupied workplaces and employees in order to get an overview of open requirements and available capacities. Workplaces and employees are considered being fully assigned, if at least 95% of the requirements and/or capacity are occupied.

The button "hide complete assignments" is only available if the modification [wpasHideFullAssignments](#) is enabled.

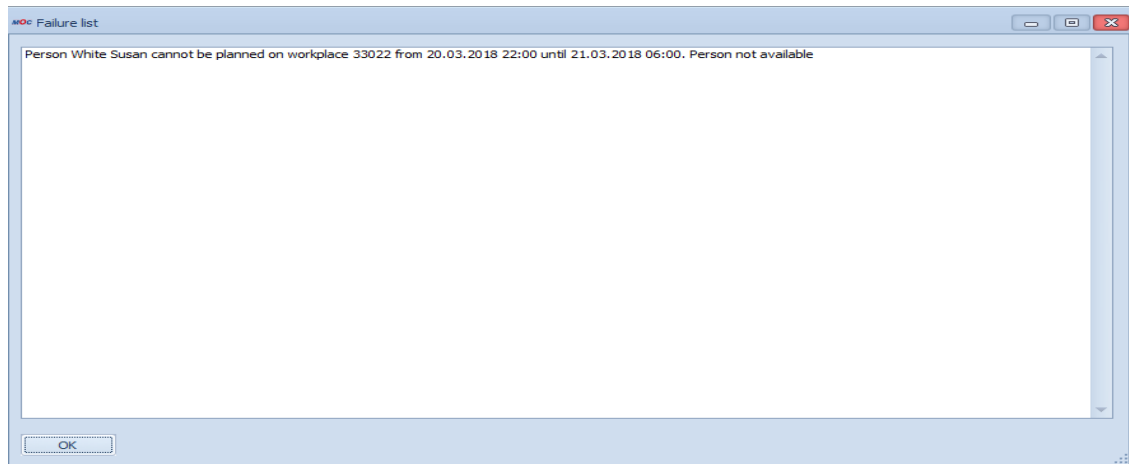

Copy assignments

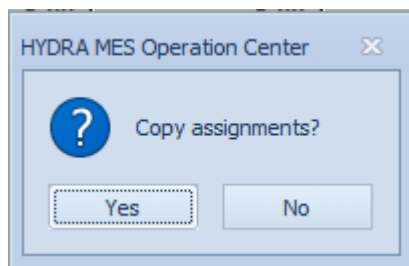

Clicking this button opens a dialog where you can copy the assignment of one period (e.g. a day or week) to another period:

You can restrict the copy option to specific workplace groups. If the field "group" remains empty, you copy the assignments of all displayed workplaces.

An error list shows the assignments that could not be copied:

After closing the error list, the following dialog appears to decide if you want to copy the assignments despite the errors:

All assignments are copied coinciding with the indicated period. The start period and the target period for copying must completely coincide with the period selected in the "workplace assignment". If this is not the case, copying is canceled issuing the error message "invalid period".

The button "Copy assignments" is only available if the modification [wpasCopyAssignments](#) is enabled.

Lock all

When you attempt to plan an employee on a workplace, the system checks if another user is currently planning the workplace. If this is the case, the following error message occurs:

"The person ... is locked by user ..."

and/or

"The workplace ... is locked by user ..."

Using the button "lock all", you can lock all displayed employees and workplaces. Therefore, you can verify at the beginning of planning if all employees and workplaces to be planned are available.

If you locked employees and workplaces (with your user data), they are highlighted with green background color. A red background color indicates that employees and workplaces locked by another user.

Upon saving assignments, the following confirmation prompt appears:

"Do you want to release locked staff and workplaces?"

Here you can decide if you want to unlock employees and workplaces or if they should remain locked in order to continue planning.

Upon finishing the "workplace assignment", the system automatically releases the locked employees and workplaces.

The following entry in the [INI configuration](#) disables the option of locking employees and workplaces as well as the check specifying if locks are available in the whole system:

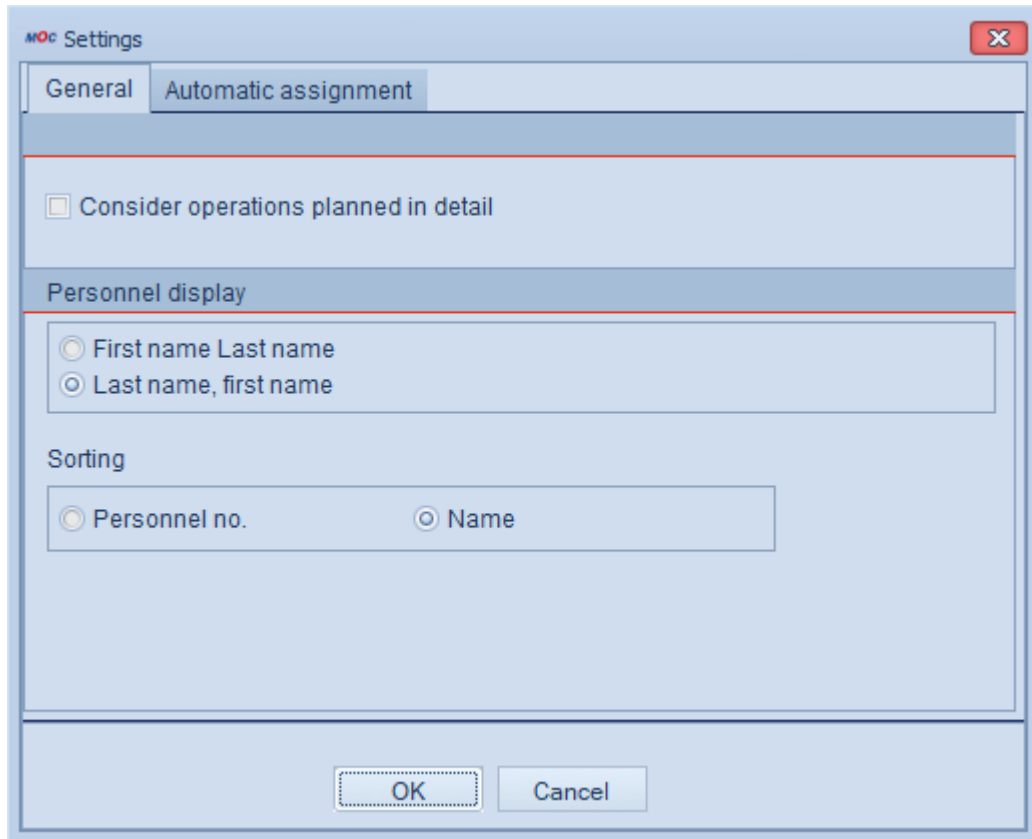

Name:	PEP
Section:	WPAS
Key:	LOCKING
Value:	FALSE

The button "Locks all" is only available if the modification [wpasLocking](#) is enabled.

Settings

The screenshot shows the 'MOC Settings' dialog box with the 'Automatic assignment' tab selected. The 'General' tab is also visible. The 'Consider operations planned in detail' checkbox is unchecked. The 'Personnel display' section has two radio buttons: 'First name Last name' (selected) and 'Last name, first name'. The 'Sorting' section has two radio buttons: 'Personnel no.' (selected) and 'Name'. The 'OK' button is highlighted with a dashed border, and the 'Cancel' button is also visible.

Include detail planned operations

If workforce requirements are generated independent of the detail planned operations, only the workforce requirements are included, which are stored at the workplace for each defined validity periods. No matter whether operations are scheduled or not.

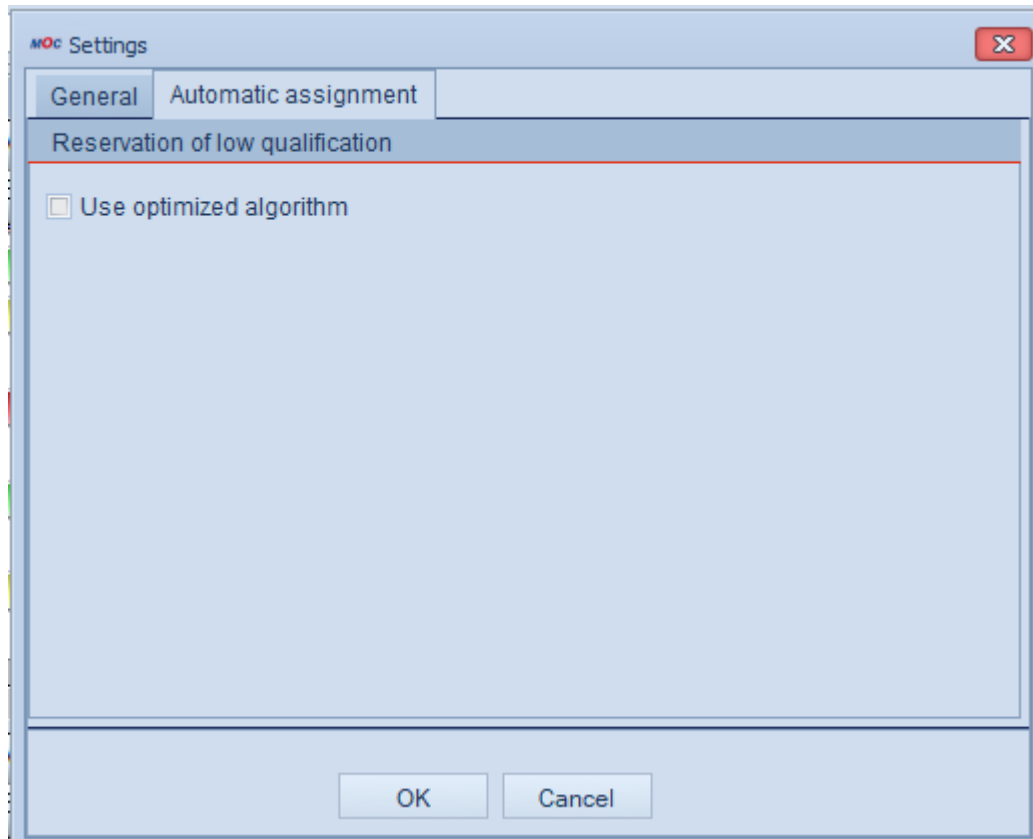

If personnel requirements are generated independent of the detail planned operations, then only periods are included for the workforce requirements that have scheduled operations (=> scheduled operations are privotal). There are three options to store workforce requirements.

First name last name or last name, first name

This field defines whether the last name is shown in front of or behind the first name.

Sorting

This option specifies whether the staff grouped by areas is sorted by the personnel number or by the name for this area.

Use optimized algorithm

This option enables the [Optimized, automatic assignment](#).

The configurations are saved with respect to the user per workplace.

Automatic workplace assignment

Click this button to call the [Automatic workplace assignment](#).

Save planning

This function saves the current workplace assignment, which is then available to all users.

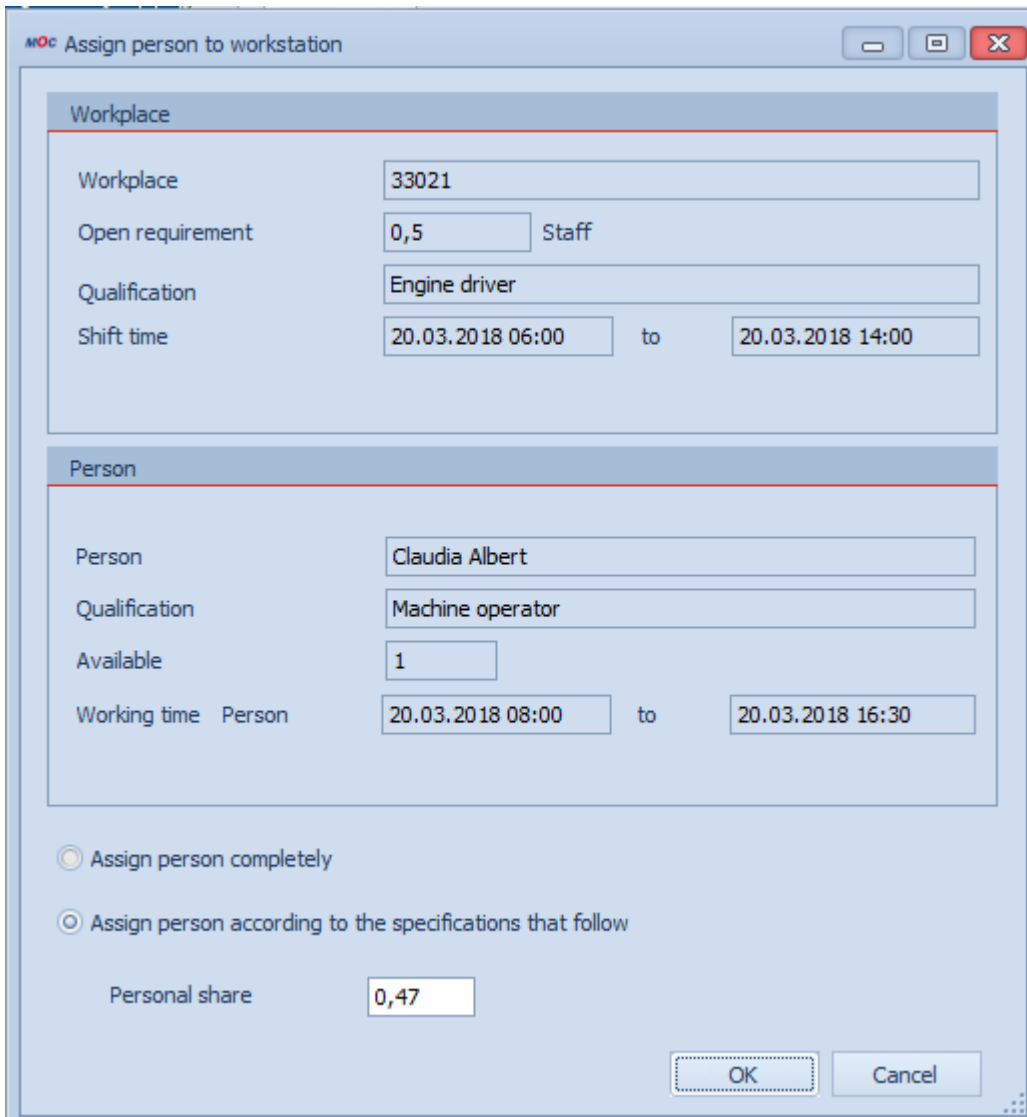

Personnel scheduling

You can call the application *Personnel scheduling* with this button.

Manual assignment

Staff can be planned manually by way of "drag & drop". To do so, select the bar of a person, hold the mouse button down and drag it to the top of a shift for a workplace. The below dialog appears, once you release the mouse button:

Workplace

Workplace: 33021

Open requirement: 0,5 Staff

Qualification: Engine driver

Shift time: 20.03.2018 06:00 to 20.03.2018 14:00

Person

Person: Claudia Albert

Qualification: Machine operator

Available: 1

Working time Person: 20.03.2018 08:00 to 20.03.2018 16:30

☒ Assign person completely

☐ Assign person according to the specifications that follow

Personal share: 0,47

OK Cancel

Workplace

Shows the workplace including the required qualification and the open requirements.

Person

Shows the person with the qualification and availability.

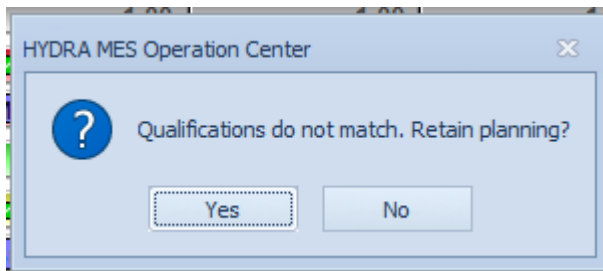

Assign person completely

The person's available time is completely assigned to the workplace, irrespective of whether this exceeds the workplace requirements or not.

Assign person according to the specifications that follow

The missing assignment is compared to the person's availability and the result is shown in this field.
You can change the suggested value.

If the person does not have the required qualification, this message appears:

It is now up to the user to decide whether or not to perform this assignment.

To remove a person from planning, the personnel bar only has to be selected and dragged back from the workplace to the pool of staff. As an alternative, you may also open the context menu by right clicking and selecting the option "cancel assignment".

HYDRA: as of service pack 13

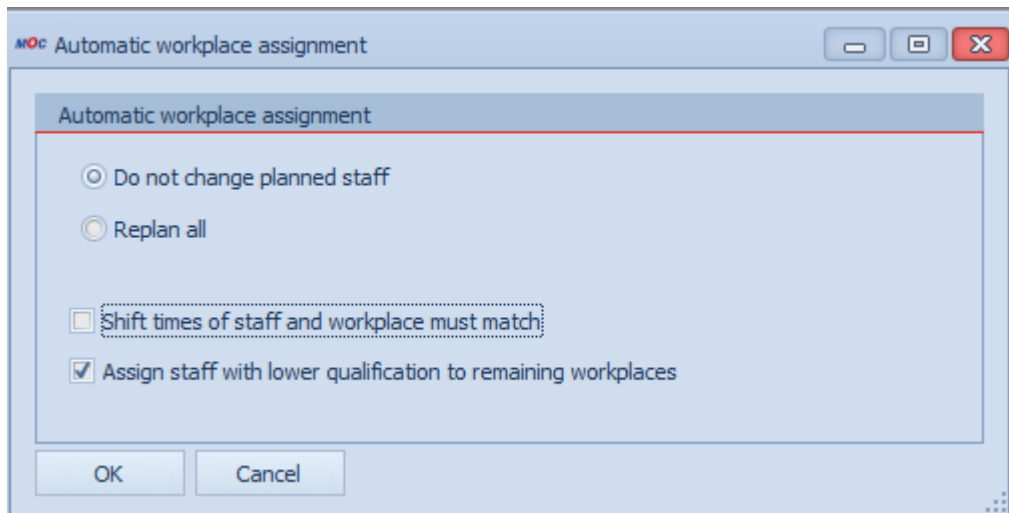

FEDRA: as of version 1.1

You can select a number of people and plan them for a requirement using drag and drop. The dialog mentioned above is called for each planning action.

Automatic assignment

The below dialog appears when starting automatic workplace assignment:

Do not change planned staff, replan all

These options specify whether already existing assignments are to be kept by automatic assignment or whether they are to be removed from planning to be planned once more.

Shift times of staff and workplace must match

Staff is only planned on workplaces with shift times matching the employee's planned standard working time.

Assign staff with lower qualification to remaining workplaces

All staff qualifications are taken into account as part of the assignment. Assignment is performed sorted by the order of priority of the employee's qualifications. If this option is not enabled, only qualifications of the highest order of priority (99) are assigned.

Before "automatic assignment" is performed, the system checks if the displayed workplaces and employees are locked by another user. If this is the case, automatic assignment is canceled.

The check specifying if workplaces and employees are locked by another user is only performed if the modification [wpasLocking](#) is enabled.

Optimized, automatic assignment

The optimized, automatic assignment function can be enabled by the [settings](#).

In contrast to the automatic assignment function described above that only considers the order of priority for qualifications, the optimized, automatic assignment function also considers the employee's flexibility. This is intended to achieve a higher assignment rate for automatic planning. The optimized assignment function works as follows:

Plan staff with only one assignment option

At first the system checks whether there is staff with only one possible assignment option. This assignment is performed regardless of whether there are employees who have a higher priority for the required qualification. Consequently, this person (with only one assignment option) does not remain unassigned.

Assignment of workplaces with only one possible operator

Then the system checks whether a qualification required by a workplace can only be met by one employee. This employee is assigned to the workplace, irrespective of whether this person still has additional qualifications of a higher order of priority. Consequently, the qualification required by this workplace does not remain unassigned.

Assignment due to the order of priority of qualifications

Just as it is the case with the standard, automatic assignment function, now the employees are assigned to the workplaces sorted by the order of priority of their qualifications. However, after each assignment the two steps described above are carried out again. The reason for it is that since the assignment of an employee can result in persons with only one remaining possible assignment or workplaces with only one possible operator being available.

The optimized algorithm is only used if the option "Assign staff with lower qualification to remaining workplaces" is enabled for automatic assignment.

Replan assignments

If you want to change planning for an employee assigned to a workplace and replan this employee to another workplace, you can do it by "drag & drop" as it is the case with manual assignments. Once you release the mouse button, the same dialog occurs as with manual assignments.

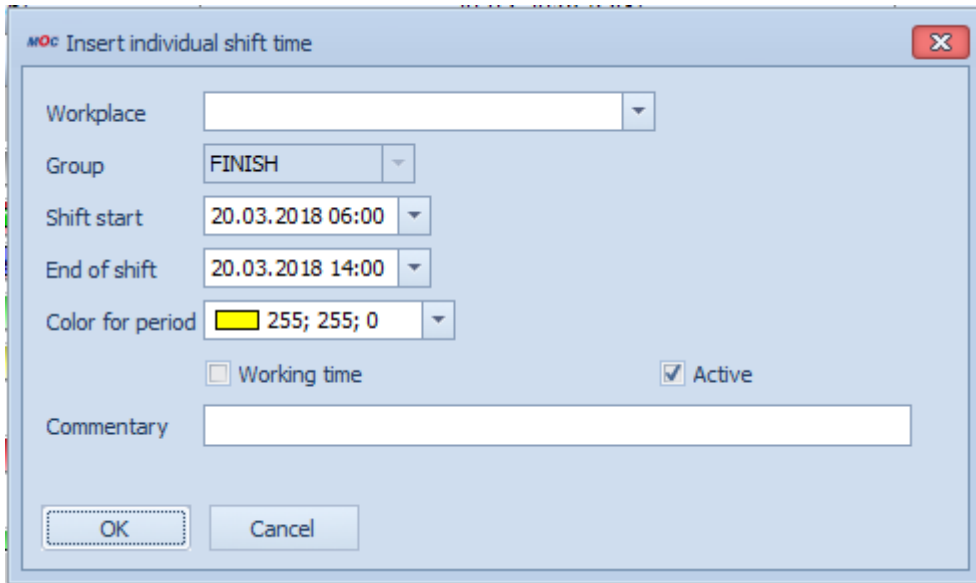

You can only replan assignments by "drag & drop" if the modification [wpasChangeAssignment](#) is enabled.

Individual shift times

Using [Individual shift times](#), you can define additional working times and times off deviating from the planned shift model for individual workplaces.

In order to change a complete or parts of the shift and to change it into "time off", just right-click the relevant shift and select the entry "Insert individual shift time" from the context menu. The following dialog opens where you can enter the period for the time off and a comment:

MOC Insert individual shift time

Workplace

Group

Shift start

End of shift

Color for period

☐ Working time ☒ Active

Commentary

OK Cancel

In order to add additional working time, just right-click a time off and select the entry "Insert individual shift time" from the context menu. Then hold the left mouse button down and drag the period for which you want to add the additional working time. Once you have released the mouse button, the above-mentioned dialog opens where you can correct the time and enter a comment. Here, you must enable the option "working time" in order to specify that it is planned working time and no time off.

Individual shift times can be changed and deleted in the application [Individual shift times](#).
