

1 Resource Status Depending on the Order Type

Overview

Menu	Master data → Resources → Resource status depending on the order type
Transaction code	resaar
Function authorization	mdaarst.*

This document describes the application "Resource Status Depending on the Order Type" within the Manufacturing Operation Center (MOC).

Purpose

Configure the order-dependent status to define how statuses should be changed subject to the order type and the posting event. This allows you to automatically change the status of a resource when an order is posted (log OP on, interrupt OP, log OP off).

Integration

Configure this table to automatically change resource statuses depending on the postings on production and maintenance orders.

Requirements

The correct and appropriate resource statuses and order types must be available in the system.

Selection criteria

In the selection panel, you can filter by superordinate or assigned resources. The application provides the following selection criteria:

Resource type

Enter the type the resource is assigned to.

Order type

Includes the order type created and configured in HYDRA.

Field descriptions

Resource type

Defines the resource type.

Family

You can enter the resource family. If the field is empty, the resource type applies. If you enter a value in the field, this value also applies.

Order type

Includes the order type.

Processing

The system determines all resources of the OP for which you configured a status change. The system triggers a corresponding RES_STATUS dialog for these resources:

A = If the OP is logged on, the system sets the resource status of the resource(s) that is/are assigned to the operation in the list of production resources and tools.

U = If the OP is interrupted, the system sets the resource status of the resources that are currently logged on to the operation.

E = If the OP is logged off, the system sets the resource status of the resources that are currently logged on to the operation.

Statuses are neither changed for anonymous resources nor for required resources.

Status

Current status. The status itself must be defined in the status assignment of resources.

If this field is empty, the status to be set merely depends on the order type.

Status to be set

Status to be set. The status itself must be defined in the status assignment of resources. In the status assignment of resources, the option "Entry" must be set to "F".

Changing of blocked resources

Changes the status, even if the resource is blocked.
