

1 Responsibility Areas

Overview

HYDRA menu	System administration → User administration → Responsibility areas
FEDRA menu	System administration → User administration → Responsibility areas
Transaction code	respa
Function authorization	respa

Purpose

Function authorizations control the access to applications/functions. You can also control the access to the data included in the system.

You use authorizations for responsibility areas to control the access to data. Example: Via responsibility areas, customers with several sites or factories can protect configurations which only apply to one site from being edited by users of other sites.

You do not explicitly create different responsibility areas and assign them to a user. A new responsibility area is created with the assignment to a user.

Integration

You can create responsibility areas for different objects.

- Machines (resources)
- Staff
- Orders / operations
- Other configurations

Requirements

Users have to be created before responsibility areas can be assigned.

Selection criteria

The application provides the following selection criteria:

Modified by

User that is included in the user administration.

Responsibility profile/area

Name of the responsibility area or profile.

Field descriptions**Responsibility profile**

Key of the responsibility profile

Responsibility area

Key of the assigned responsibility area

Authorizations

Authorizations specify how the user can edit or use the data.

Display: The user can view the data.

Use: Only used in PZE/PZW: The user can use the data in other applications, e.g. payment day types in the absence planning.

Insert: The user can create new data records.

Modify: The user can edit existing data records.

Delete: The user can delete data records.

If you assign several responsibility profiles to one user, the user might be assigned one responsibility area multiple times with different authorizations each. In this case, the user obtains all enabled authorizations for this responsibility area (linked via OR).

In the Shop Floor Scheduling, the options "Authorizations" are not used. If a user in the Shop Floor Scheduling should only have the authorization "Display", you must remove the other function authorizations.
