

1 Responsibility Profiles

Overview

HYDRA menu	System administration → User administration → Responsibility profiles
FEDRA menu	System administration → User administration → Responsibility profiles
Transaction code	rpp.*
Function authorization	respp

Purpose

You use responsibility profiles to easily assign authorizations in the administration of responsibility areas. A responsibility profile includes one or more responsibility areas.

If you assign a responsibility profile to a user, the user automatically obtains all responsibility areas included in the profile.

If you assign several responsibility profiles to one user, the user might be assigned one responsibility area multiple times with different authorizations each. In this case, the user obtains all enabled authorizations for this responsibility area (linked via OR).

If you change the profile subsequently, the changes are directly enabled when the user logs on the next time.

Integration

You can create responsibility areas for different objects.

- Machines (resources)
- Staff
- Orders / operations
- Other configurations

Requirements

To assign responsibility profiles to users, you must have created the users.

Selection criteria

The application provides the following selection criteria:

Responsibility profile

Use the name to select the created responsibility profiles (you can enter wildcards).

Field descriptions

Responsibility profile

Responsibility profile the responsibility area is assigned to.

Responsibility area

Responsibility areas that are grouped to a responsibility profile.

Authorizations

Authorizations specify how the user can edit or use the data.

Display:	The user can view the data.
Use:	Only used in PZE/PZW: The user can use the data in other applications, e.g. payment day types in the absence planning.
Insert:	The user can create new data records.
Modify:	The user can edit existing data records.
Delete:	The user can delete data records.
