

1 Status Profile

Summary

Menu	Operating facilities management → Status analyses → Status profile
Transaction code	mstpf
Function authorization	mstpf

Usage

The status profile evaluates the statuses by shift, by day, by calendar week or by month over a certain period of time. The result depends on the selection and therefore on the selection criteria made available on the selection panel.

Selection criteria

The application provides the following selection criteria:

Workplace

Search by machine/ by workplace. There is an option to search using wild cards.

Group

Search by workplaces/ machines that are assigned to the group that was entered. The selection is made using the field group in the workplace/ machine configuration. You can run a search using wildcards.

Cost center

Search by workplaces/ machines that are assigned to the cost center that was entered. You can run a search using wildcards.

Company

Search by workplaces/ machines that are assigned to the company that was entered. You can run a search using wildcards.

Responsibility area

This selection criterion references the responsibility area in the machine master data. Keep in mind that only machines are displayed that the user has also assigned responsibility areas to.

Report group

This selection criterion references the report groups. All machines or workplaces are displayed that are assigned to the selected report group.

Short designation

This selection criterion references the short name of the machines in the master data. All of the machines or workplaces are displayed that match the string that was entered. You can also run a search using wildcards.

Designation

This selection criterion references the name of the machines and workplaces in the machine's master data. At the bottom, only those machines are displayed that are identical to the string that was entered. You can also run a search using wildcards (placeholders *) in this field.

Status text

Limits the selection to a certain status. Displayed in the combo box are the status texts that the selection can be filtered through.

Inclusive status for RPA 11

Accounts for the status for RPA 11 (usually, this is the "Production" status).

Date

The period of time from which data should be selected.

When selecting via shift(s), the shift date is evaluated, whereas when selecting by time, the selection is based on the start date. Please keep in mind that a selection by shift is only supported for ADE and MDE data, not for WRM data.

Shift(s)/ time

Selection by shift (only ADE and MDE events) or by time period. If no shift has been selected, all shifts are considered.

The two times each refer to the start or to the end of the date periods listed above.

Order/ article

When you choose the option "Order", you must enter an order or an article.

For this kind of evaluation type, only the finished ADE postings are considered. If the order is currently still running on the machine, the time period between the last logon and now is not taken into account. As such, it is by all means possible that there are differences between the machine evaluation and the order-related evaluation. Only ADE postings are taken into account that have started during the evaluation period. If necessary, the selection period must be selected so that the ADE postings that are to be taken into account are within this selection period. For this order-related evaluation, MPDV recommends the shift-related selection option.

The following illustration shows an example of an overlapping of ADE and MDE postings. The ADE postings take priority in this evaluation type. The yellow areas illustrate the results of this evaluation. MDE quantities and durations are calculated on a pro rata basis to achieve the result.

If orders are logged on in parallel at the machine, for this evaluation type, the full machine time (yellow area) and quantity is assigned to each order. The fact that orders are run in parallel will not result in a proportionate calculation.

Resource type/ resource

When choosing the option "Resource", a resource must be entered.

For this kind of evaluation type, here again only the finished postings are considered. For this evaluation type the resource postings take priority. The principle is the same as when running an evaluation by order.

Additional selection notes

Long term data

If the selection period exceeds the period for the online data area, the system applies the implicit solution and selects the medium-term data area as well. Therefore, there is no need for an explicit activation in order to be able to access the medium-term data set.

Determining a shift-adjusted quantity

This option known from MDE 7.2 is set by default in MOC. What this means is that postings that were generated as a result of a shift change are not considered when determining the quantity. All that is accounted for here is the exact moment when a machine status was set. If this moment is outside of the evaluation interval, in this case the output will be 0.

Status profile detail application

Tabular presentation of the status with the following columns:

Shift date/ shift/ calendar week/ year

The durations in the statuses are displayed in groups by shift (i.e. shift date/ shift number). Calendar week, month and year (based on the shift date) are provided as additional sorting/ grouping criteria.

Status/ designation

Number and designation of the status. The status column is displayed in color as defined in the status text configuration.

RPA

Resource performance account number

Abbreviation

Abbreviation of the status class

Duration

Total time of all statuses within the evaluation period.

Quantity

Total number of statuses that was applicable during the evaluation period.

Pivot table detail application

You can evaluate status based on additional criteria in the pivot table detail view.

The bar colors in the chart are set "arbitrarily" using a color chart defined internally.
